INTERLEUKIN-3 (IL-3) MULTIPLE MUTATION POLYPEPTIDES

This is a continuation-in-part of United States
Application Serial No. 07/981,044 filed November 24,
5 1992 which is incorporated herein by reference.

Field of the Invention

The present invention relates to mutants or variants of human interleukin-3 (hIL-3) which contain multiple amino acid substitutions and which may have portions of the native hIL-3 molecule deleted. These hIL-3 multiple mutation polypeptides retain one or more activities of native hIL-3 and may also show improved hematopoietic cell-stimulating activity and/or an improved activity profile which may include reduction of undesirable biological activities associated with native hIL-3.

Background of the Invention

20 Colony stimulating factors (CSFs) which stimulate the differentiation and/or proliferation of bone marrow cells have generated much interest because of their therapeutic potential for restoring depressed levels of hematopoietic stem cell-derived cells. CSFs 25 in both human and murine systems have been identified and distinguished according to their activities. example, granulocyte-CSF (G-CSF) and macrophage-CSF (M-CSF) stimulate the in vitro formation of neutrophilic granulocyte and macrophage colonies, 30 respectively while GM-CSF and interleukin-3 (IL-3) have broader activities and stimulate the formation of both macrophage, neutrophilic and eosinophilic granulocyte colonies. IL-3 also stimulates the formation of mast, megakaryocyte and pure and mixed 35 erythroid colonies.

Because of its ability to stimulate the

proliferation of a number of different cell types and to support the growth and proliferation of progenitor cells, IL-3 has potential for therapeutic use in restoring hematopoietic cells to normal amounts in those cases where the number of cells has been reduced due to diseases or to therapeutic treatments such as radiation and chemotherapy.

Interleukin-3 (IL-3) is a hematopoietic growth 10 factor which has the property of being able to promote the survival, growth and differentiation of hematopoietic cells. Among the biological properties of IL-3 are the ability (a) to support the growth and differentiation of progenitor cells committed to all, or virtually all, blood cell lineages; (b) to interact 15 with early multipotential stem cells; (c) to sustain the growth of pluripotent precursor cells; (d) to stimulate proliferation of chronic myelogenous leukemia (CML) cells; (e) to stimulate proliferation 20 of mast cells, eosinophils and basophils; (f) to stimulate DNA synthesis by human acute myelogenous leukemia (AML) cells; (g) to prime cells for production of leukotrienes and histamines; (h) to induce leukocyte chemotaxis; and (i) to induce cell 25 surface molecules needed for leukocyte adhesion.

Mature human interleukin-3 (hIL-3) consists of 133 amino acids. It has one disulfide bridge and two potential glycosylation sites (Yang, et al., CELL $\underline{47}$:3 (1986)).

Murine IL-3 (mIL-3) was first identified by Ihle, et al., J. IMMUNOL. 126:2184 (1981) as a factor which induced expression of a T cell associated enzyme, 20_-hydroxysteroid dehydrogenase. The factor was purified to homogeneity and shown to regulate the growth and differentiation of numerous subclasses of early hematopoietic and lymphoid progenitor cells.

In 1984, cDNA clones coding for murine IL-3 were isolated (Fung, et al., NATURE 307:233 (1984) and Yokota, et al., PROC. NATL. ACAD. SCI. USA 81:1070 (1984)). The murine DNA sequence coded for a polypeptide of 166 amino acids including a putative signal peptide.

The gibbon IL-3 sequence was obtained using a gibbon cDNA expression library. The gibbon IL-3 sequence was then used as a probe against a human genomic library to obtain a human IL-3 sequence.

10

15

30

35

Gibbon and human genomic DNA homologues of the murine IL-3 sequence were disclosed by Yang, et al., CELL 47:3 (1986). The human sequence reported by Yang, et al. included a serine residue at position 8 of the mature protein sequence. Following this finding, others reported isolation of Pro⁸ hIL-3 cDNAs having proline at position 8 of the protein sequence. Thus it appears that there may be two allelic forms of hIL-3.

Dorssers, et al., GENE <u>55</u>:115 (1987), found a clone from a human cDNA library which hybridized with mIL-3. This hybridization was the result of the high degree of homology between the 3' noncoding regions of mIL-3 and hIL-3. This cDNA coded for an hIL-3 (Pro⁸) sequence.

U.S. 4,877,729 and U.S. 4,959,454 disclose human IL-3 and gibbon IL-3 cDNAs and the protein sequences for which they code. The hIL-3 disclosed has serine rather than proline at position 8 in the protein sequence.

Clark-Lewis, et al., SCIENCE <u>231</u>:134 (1986) performed a functional analysis of murine IL-3 analogues synthesized with an automated peptide synthesizer. The authors concluded that the stable tertiary structure of the complete molecule was required for full activity. A study on the role of

the disulfide bridges showed that replacement of all four cysteines by alanine gave a molecule with 1/500th the activity as the native molecule. Replacement of two of the four Cys residues by Ala(Cys⁷⁹, Cys¹⁴⁰ -> 5 Ala⁷⁹, Ala¹⁴⁰) resulted in an increased activity. The authors concluded that in murine IL-3 a single disulfide bridge is required between cysteines 17 and 80 to get biological activity that approximates physiological levels and that this structure probably stabilizes the tertiary structure of the protein to give a conformation that is optimal for function. (Clark-Lewis, et al., PROC. NATL. ACAD. SCI. USA 85:7897 (1988)).

International Patent Application (PCT) WO

88/00598 discloses gibbon- and human-like IL-3. The
hIL-3 contains a Ser⁸ -> Pro⁸ replacement.

Suggestions are made to replace Cys by Ser, thereby
breaking the disulfide bridge, and to replace one or
more amino acids at the glycosylation sites.

20

25

30

EP-A-0275598 (WO 88/04691) illustrates that Ala¹ can be deleted while retaining biological activity. Some mutant hIL-3 sequences are provided, e.g., two double mutants, Ala¹ -> Asp¹, Trp¹³ -> Arg¹³ (pGB/IL-302) and Ala¹ -> Asp¹, Met³ -> Thr³ (pGB/IL-304) and one triple mutant Ala¹ -> Asp¹, Leu⁹ -> Pro⁹, Trp¹³ -> Arg¹³ (pGB/IL-303).

WO 88/05469 describes how deglycosylation mutants can be obtained and suggests mutants of ${\rm Arg^{54}Arg^{55}}$ and ${\rm Arg^{108}Arg^{109}Lys^{110}}$ might avoid proteolysis upon expression in <u>Saccharomyces cerevisiae</u> by KEX2 protease. No mutated proteins are disclosed. Glycosylation and the KEX2 protease activity are only important, in this context, upon expression in yeast.

WO 88/06161 mentions various mutants which
theoretically may be conformationally and
antigenically neutral. The only actually performed

mutations are Met^2 -> Ile^2 and Ile^{131} -> Leu^{131} . It is not disclosed whether the contemplated neutralities were obtained for these two mutations.

WO 91/00350 discloses nonglycosylated hIL-3 analog proteins, for example, hIL-3 (Pro8Asp15Asp70), Met3 rhul-3 (Pro8Asp15Asp70); Thr4 rhuL-3 (Pro8Asp15Asp70) and Thr6 rhuIL-3 (Pro8Asp15Asp70). It is said that these protein compositions do not exhibit certain adverse side effects associated with native hIL-3 such as urticaria resulting from infiltration of mast cells and lymphocytes into the dermis. The disclosed analog hIL-3 proteins may have N termini at Met3, Thr4, or Thr6.

WO 91/12874 discloses cysteine added variants (CAVs) of IL-3 which have at least one Cys residue substituted for a naturally occurring amino acid residue.

10

Summary of the Invention

20 The present invention relates to recombinant human interleukin-3 (hIL-3) variant or mutant proteins (muteins). These hIL-3 muteins contain amino acid substitutions and may also have amino acid deletions at either/or both the N- and C- termini. Preferably, 25 these mutant polypeptides of the present invention contain four or more amino acids which differ from the amino acids found at the corresponding positions in the native hIL-3 polypeptide. The invention also relates to pharmaceutical compositions containing the 30 hIL-3 muteins, DNA coding for the muteins, and methods for using the muteins. Additionally, the present invention relates to recombinant expression vectors comprising nucleotide sequences encoding the hIL-3 muteins, related microbial expression systems, and 35 processes for making the hIL-3 muteins using the microbial expression systems.

The present invention includes mutants of hIL-3 in which from 1 to 14 amino acids have been deleted from the N-terminus and/or from 1 to 15 amino acids have been deleted from the C-terminus, and in which multiple amino acid substitutions have been made. Preferred muteins of the present invention are those in which amino acids 1 to 14 have been deleted from the N-terminus, amino acids 126 to 133 have been deleted from the C-terminus, and which also contain from about four to about twenty-six amino acid 10 substitutions in the polypeptide sequence. These hIL-3 multiple mutation polypeptides may have biological activities similar to or better than hIL-3 and, in some cases, may also have an improved side effect 15 profile, i.e., some muteins may have a better therapeutic index than native hIL-3. The present invention also provides muteins which may function as IL-3 antagonists or as discrete antigenic fragments for the production of antibodies useful in immunoassay 20 and immunotherapy protocols. In addition to the use of the hIL-3 multiple mutation polypeptides of the present invention in vivo, it is envisioned that in vitro uses would include the ability to stimulate bone marrow and blood cell activation and growth before 25 infusion into patients.

Antagonists of hIL-3 would be particularly useful in blocking the growth of certain cancer cells like AML, CML and certain types of B lymphoid cancers. Other conditions where antagonists would be useful include those in which certain blood cells are produced at abnormally high numbers or are being activated by endogenous ligands. Antagonists would effectively compete for ligands, presumably naturally occurring hemopoietins including and not limited to IL-3, GM-CSF and IL-5, which might trigger or augment the growth of cancer cells by virtue of their ability

30

to bind to the IL-3 receptor complex while intrinsic activation properties of the ligand are diminished. IL-3, GM-CSF and/or IL-5 also play a role in certain asthmatic responses. An antagonist of the IL-3 receptor may have the utility in this disease by blocking receptor-mediated activation and recruitment of inflammatory cells.

Brief Description of the Drawings

10 Figure 1 is the human IL-3 gene for <u>E</u>. <u>coli</u> expression (pMON5873), encoding the polypeptide sequence of natural (wild type) human IL-3 [SEQ ID NO:128], plus an initiator methionine, as expressed in <u>E</u>. <u>coli</u>, with the amino acids numbered from the N-terminus of the natural hIL-3.

Figure 2: ClaI to NsiI Replacement Fragment. Figure 2 shows the nucleotide sequence of the replacement fragment used between the ClaI and NsiI sites of the hIL-3 gene. The codon choice used in the fragment corresponds to that found in highly expressed E. coli genes (Gouy and Gautier, 1982). Three new unique restriction sites, EcoRV, XhoI and PstI were introduced for the purpose of inserting synthetic gene fragments. The portion of the coding sequence shown encodes hIL-3 amino acids 20-70.

20

25

30

Figure 3 shows the nucleotide and amino acid sequence of the gene in pMON5873 with the sequence extending from NcoI through HindIII. The codon choices used to encode amino acids 1-14 and 107-133 correspond to that found in highly expressed $\underline{\textbf{E}}$. $\underline{\textbf{coli}}$ genes.

Detailed Description of the Invention

35 The present invention relates to muteins of human interleukin-3 (hIL-3) in which amino acid

substitutions have been made at four or more positions in amino acid sequence of the polypeptide and to muteins which have substantially the same structure and substantially the same biological activity.

Preferred muteins of the present invention are (15-125)hIL-3 deletion mutants which have deletions of amino acids 1 to 14 at the N-terminus and 126 to 133 at the C-terminus and which also have four or more amino acid substitutions in the polypeptide and

muteins having substantially the same structure and substantially the same biological activity. Among the preferred muteins are those having twenty-six amino acid substitutions. As used herein human interleukin-3 corresponds to the amino acid sequence (1-133) as

depicted in Figure 1 and (15-125) hIL-3 corresponds to the 15 to 125 amino acid sequence of the hIL-3 polypeptide. Naturally occurring variants of hIL-3 polypeptide amino acids are also included in the present invention (for example, the allele in which

proline rather than serine is at position 8 in the hIL-3 polypeptide sequence) as are variant hIL-3 molecules which are modified post-translationally (e.g. glycosylation).

20

25

30

35

The present invention also includes the DNA sequences which code for the mutant polypeptides, DNA sequences which are substantially similar and perform substantially the same function, and DNA sequences which differ from the DNAs encoding the muteins of the invention only due to the degeneracy of the genetic code.

Included in the present invention are novel mutant human interleukin-3 polypeptides comprising a polypeptide having the amino acid sequence of native human interleukin-3 wherein amino acids 126 to 133 have been deleted from the C-terminus of the native human interleukin-3 polypeptide and amino acids 1 to

14 have been deleted from the N-terminus of the native human interleukin-3 polypeptide and, in addition, polypeptides also have four or more amino acid substitutions in the polypeptide sequence.

Also included in the present invention are the DNA sequences coding for the muteins of the present invention; the oligonucleotide intermediates used to construct the mutant DNAs; and the polypeptides coded for by these oligonucleotides. These polypeptides may be useful as antagonists or as antigenic fragments for the production of antibodies useful in immunoassay and immunotherapy protocols.

The mutant hIL-3 polypeptides of the present invention may also have methionine, alanine, or methionine-alanine residues inserted at the N-terminus.

The present invention includes human interleukin-3 mutant polypeptide Formula I:

wherein

- Xaa at position 3 is Ser, Gly, Asp, Met, or Gln;
 Xaa at position 4 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
 Xaa at position 5 is Met, Phe, Ile, Arg, or Ala;
 Xaa at position 6 is Ile or Pro;
 Xaa at position 7 is Asp, or Glu;
- Xaa at position 9 is Ile, Val, Ala, Leu, or Gly;
 Xaa at position 10 is Ile, Val, Phe, or Leu;
 Xaa at position 11 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
 Xaa at position 12 is His, Phe, Gly, Arg, or Ala;
 Xaa at position 14 is Lys, Leu, Gln, Gly, Pro, or Val;
- Xaa at position 15 is Gln, Asn, Leu, Arg, or Val;
 Xaa at position 16 is Pro, His, Thr, Gly, or Gln;
 Xaa at position 17 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;
 Xaa at position 18 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;
 Xaa at position 19 is Pro, Leu, Gln, Ala, or Glu;
- Xaa at position 20 is Leu, Val, Gly, Ser, Lys, Ala, Arg, Gln, Glu, Ile, Phe, Thr or Met;
 Xaa at position 21 is Leu, Ala, Asn, Pro, Gln, or Val;

Xaa at position 23 is Phe, Ser, Pro, Trp, or Ile;

Xaa at position 22 is Asp or Leu;

35 Xaa at position 24 is Asn or Ala; Xaa at position 27 is Asn, Cys, Arg, His, Met, or Pro;

Xaa at position 30 is Asp, or Glu;

Xaa at position 31 is Gln, Val, Met, Leu, Thr, Lys, Ala, Asn Glu,

5 Ser or Trp;

Xaa at position 32 is Asp, Phe, Ser, Thr, Cys, Ala, Asn, Gln,
Glu, His, Ile, Lys, Tyr, Val or Gly;

Xaa at position 33 is Ile, Val, or His;

Xaa at position 35 is Met, Asn, or Asp;

10 Xaa at position 36 is Glu, Thr, Ala, Asn, Ser or Asp;

Xaa at position 37 is Asn, Arg, Met, Pro, Ser, Thr, or His;

Xaa at position 38 is Asn or Gly;

Xaa at position 39 is Leu, Met, or Phe;

Xaa at position 40 is Arg, Ala or Ser;

15 Xaa at position 41 is Arg, Thr, Val, Leu, or Gly;

Xaa at position 42 is Pro, Gly, Cys, Ser, Gln, Ala, Arg, Asn, Glu, His, Leu, Thr, Val or Lys;

Xaa at position 45 is Glu, Tyr, His, Leu, or Arg;

Xaa at position 46 is Ala, Ser, Asn, or Thr;

20 Xaa at position 47 is Phe or Ser;

Xaa at position 48 is Asn, Val, Pro, Thr, or Ile;

Xaa at position 49 is Arg, Tyr, Lys, Ser, His, or Val;

Xaa at position 50 is Ala or Asn;

Xaa at position 51 is Val, Thr, Leu, or Ser;

25 Xaa at position 52 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;

Xaa at position 53 is Ser, Phe, Val, Gly, Asn, Ile, or His;

Xaa at position 54 is Leu, Val, Ile, Phe, or His;

Xaa at position 55 is Gln, Ala, Pro, Thr, Glu, Arg, or Gly;

Xaa at position 56 is Asn or Pro;

30 Xaa at position 57 is Ala, Met, Pro, Arg, Glu, Thr, or Gln;

Xaa at position 58 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;

Xaa at position 59 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, Arg, or Pro;

Xaa at position 60 is Ile or Met;

35 Xaa at position 61 is Glu, Gly, Asp, Ser, or Gln;

Xaa at position 62 is Ser, Val, Ala, Asn, Glu, Pro, Gly, or

Asp;

Xaa at position 63 is Ile, Ser, or Leu;

Xaa at position 65 is Lys, Thr, Gly, Asn, Met, Arg, Ile, or Asp;

5 Xaa at position 66 is Asn, Val, Gly, Thr, Leu, Glu, or Arg;

Xaa at position 67 is Leu, or Val;

Xaa at position 68 is Leu, Gln, Trp, Arg, Asp, Ala, Asn, Glu,
 His, Met, Phe, Ser, Thr, Tyr or Val;

Xaa at position 69 is Pro, Ala, Thr, Trp, or Met;

10 Xaa at position 71 is Leu or Val;

Xaa at position 73 is Leu or Ser;

Xaa at position 74 is Ala, Arg, or Trp;

Xaa at position 75 is Thr, Asp, Glu, His, Asn, or Ser;

Xaa at position 76 is Ala, Asp, or Met;

15 Xaa at position 77 is Ala, Pro, Ser, Thr, Phe, Leu, or Asp;

Xaa at position 78 is Pro or Ser;

Xaa at position 79 is Thr, Asp, Ser, Pro, Ala, Leu, or Arg;

Xaa at position 81 is His, Pro, Arg, Val, Leu, Gly, Asn, Ile, Phe,

20 Ser or Thr;

Xaa at position 82 is Pro or Tyr;

Xaa at position 83 is Ile, Val, or Ala;

Xaa at position 84 is His, Ile, Asn, Leu, Asp, Ala, Thr,

Arg, Gln, Glu, Lys, Met, Ser, Tyr, Val or Pro;

25 Xaa at position 85 is Ile, Leu, Val, or Phe;

Xaa at position 86 is Lys, Leu, His, Arg, Ile, Gln, Pro or Ser;

30 Xaa at position 88 is Gly, Glu, Lys, or Ser;

Xaa at position 90 is Trp, Val, Tyr, Met, or Leu;

Xaa at position 91 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr, Leu, Lys, Ile, Asp, or His;

Xaa at position 92 is Glu, Ser, Ala, or Gly;

35 Xaa at position 94 is Arg, Ala, Gln, Ser or Lys;

Xaa at position 95 is Arg, Thr, Glu, Leu, Ser, or Gly;

Xaa at position 98 is Thr, Val, Gln, Glu, His, or Ser; Xaa at position 100 is Tyr or Trp; Xaa at position 101 is Leu or Ala; Xaa at position 102 is Lys, Thr, Met, Val, Trp, Ser, Leu, Ala, Asn, Gln, His, Met, Phe, Tyr or Ile; Xaa at position 103 is Thr, Ser, or Asn; Xaa at position 105 is Glu, Ser, Pro, Leu, Thr, or Tyr; Xaa at position 106 is Asn, Pro, Leu, His, Val, or Gln; Xaa at position 107 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or 10 Gly; Xaa at position 108 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His, Ile, Tyr, or Cys; Xaa at position 109 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu; 15 and which can additionally have Met- or Met-Ala- preceding the amino acid in position 1; and wherein from 4 to 44 of the amino acids designated by Xaa are different from the corresponding amino acids of native (1-133) human interleukin-3; or a polypeptide having substantially the same structure and 20 substantially the same biological activity. "Mutant amino acid sequence," "mutant protein" or "mutant polypeptide" refers to a polypeptide having an amino acid sequence which varies from a native sequence or is encoded by a nucleotide sequence intentionally made variant from a native sequence.

35

"Mutant protein," "variant protein" or "mutein" means a protein comprising a mutant amino acid sequence and includes polypeptides which differ from the amino acid sequence of native hIL-3 due to amino acid deletions, substitutions, or both. "Native sequence" refers to an amino acid or nucleic acid sequence which is identical to a wild-type or native form of a gene or protein.

Human IL-3 can be characterized by its ability to 10 stimulate colony formation by human hematopoietic progenitor cells. The colonies formed include erythroid, granulocyte, megakaryocyte, granulocytic macrophages and mixtures thereof. Human IL-3 has demonstrated an ability to restore bone marrow 15 function and peripheral blood cell populations to therapeutically beneficial levels in studies performed initially in primates and subsequently in humans (Gillio, A. P., et al. (1990); Ganser, A, et al. (1990); Falk, S., et al. (1991). Additional 20 activities of hIL-3 include the ability to stimulate leukocyte migration and chemotaxis; the ability to prime human leukocytes to produce high levels of inflammatory mediators like leukotrienes and histamine; the ability to induce cell surface 25 expression of molecules needed for leukocyte adhesion; and the ability to trigger dermal inflammatory responses and fever. Many or all of these biological activities of hIL-3 involve signal transduction and high affinity receptor binding. Mutant polypeptides 30 of the present invention may exhibit useful properties such as having similar or greater biological activity when compared to native hIL-3 or by having improved half-life or decreased adverse side effects, or a combination of these properties. They may also be 35 useful as antagonists. hIL-3 mutant polypeptides which have little or no activity when compared to

native hIL-3 may still be useful as antagonists, as antigens for the production of antibodies for use in immunology or immunotherapy, as genetic probes or as intermediates used to construct other useful hIL-3 muteins. Since hIL-3 functions by binding to its receptor(s) and triggering second messages resulting in competent signal transduction, hIL-3 muteins of this invention may be useful in helping to determine which specific amino acid sequences are responsible for these activities.

The novel hIL-3 mutant polypeptides of the present invention will preferably have at least one biological property of human IL-3 or of an IL-3-like growth factor and may have more than one IL-3-like biological property, or an improved property, or a reduction in an undesirable biological property of human IL-3. Some mutant polypeptides of the present invention may also exhibit an improved side effect profile. For example, they may exhibit a decrease in leukotriene release or histamine release when compared to native hIL-3 or (15-125) hIL-3. Such hIL-3 or hIL-3-like biological properties may include one or more of the following biological characteristics and in vivo and in vitro activities.

One such property is the support of the growth and differentiation of progenitor cells committed to erythroid, lymphoid, and myeloid lineages. For example, in a standard human bone marrow assay, an IL-3-like biological property is the stimulation of granulocytic type colonies, megakaryocytic type colonies, monocyte/macrophage type colonies, and erythroid bursts. Other IL-3-like properties are the interaction with early multipotential stem cells, the sustaining of the growth of pluripotent precursor cells, the ability to stimulate chronic myelogenous leukemia (CML) cell proliferation, the stimulation of

proliferation of mast cells, the ability to support the growth of various factor-dependent cell lines, and the ability to trigger immature bone marrow cell progenitors. Other biological properties of IL-3 have been disclosed in the art. Human IL-3 also has some biological activities which may in some cases be undesirable, for example the ability to stimulate leukotriene release and the ability to stimulate increased histamine synthesis in spleen and bone marrow cultures and in vivo.

Biological activity of hIL-3 and hIL-3 mutant proteins of the present invention is determined by DNA synthesis by human acute myelogenous leukemia cells (AML). The factor-dependent cell line AML 193 was adapted for use in testing biological activity.

10

15

20

25

30

35

One object of the present invention is to provide hIL-3 muteins and hIL-3 deletion muteins with four or more amino acid substitutions in the polypeptide sequence which have similar or improved biological activity in relation to native hIL-3 or native (15-125) hIL-3.

The present invention includes mutant polypeptides comprising minimally amino acids residues 15 to 118 of hIL-3 with or without additional amino acid extensions to the N-terminus and/or C-terminus which further contain four or more amino acid substitutions in the amino acid sequence of the polypeptide. It has been found that the (15-125)hIL-3 mutant is more soluble than is hIL-3 when expressed in the cytoplasm of \underline{E} . \underline{coli} , and the protein is secreted to the periplasm in \underline{E} . \underline{coli} at higher levels compared to native hIL-3.

When expressed in the \underline{E} . $\underline{\operatorname{coli}}$ cytoplasm, the above-mentioned mutant hIL-3 polypeptides of the present invention may also be constructed with Met-Ala- at the N-terminus so that upon expression the Met

is cleaved off leaving Ala at the N-terminus. mutant hIL-3 polypeptides may also be expressed in E. coli by fusing a signal peptide to the N-terminus. This signal peptide is cleaved from the polypeptide as part of the secretion process. Secretion in E. coli can be used to obtain the correct amino acid at the Nterminus (e.g., Asn^{15} in the (15-125) hIL-3 polypeptide) due to the precise nature of the signal peptidase. This is in contrast to the heterogeneity often observed at the N-terminus of proteins expressed in the cytoplasm in E. coli.

10

15

20

25

30

35

The hIL-3 mutant polypeptides of the present invention may have hIL-3 or hIL-3-like activity. For example, they may possess one or more of the biological activities of native hIL-3 and may be useful in stimulating the production of hematopoietic cells by human or primate progenitor cells. The hIL-3 muteins of the present invention and pharmaceutical compositions containing them may be useful in the treatment of conditions in which hematopoietic cell populations have been reduced or destroyed due to disease or to treatments such as radiation or chemotherapy.

hIL-3 muteins of the present invention may also be useful as antagonists which block the hIL-3 receptor by binding specifically to it and preventing binding of the agonist.

One potential advantage of the (15-125) hIL-3 muteins of the present invention, particularly those which retain activity similar to or better than that of native hIL-3, is that it may be possible to use a smaller amount of the biologically active mutein to produce the desired therapeutic effect. This may make it possible to reduce the number of treatments necessary to produce the desired therapeutic effect.

The use of smaller amounts may also reduce the

possibility of any potential antigenic effects or other possible undesirable side effects. For example, if a desired therapeutic effect can be achieved with a smaller amount of polypeptide it may be possible to reduce or eliminate side effects associated with the administration of native IL-3 such as the stimulation of leukotriene and/or histamine release. The hIL-3 muteins of the present invention may also be useful in the activation of stem cells or progenitors which have low receptor numbers. Pharmaceutical compositions containing (15-125) hIL-3 muteins of the present invention can be administered parenterally, intravenously, or subcutaneously.

15

20

25

30

35

As another aspect of the present invention, there is provided a novel method for producing the novel family of human IL-3 muteins. The method of the present invention involves culturing a suitable cell or cell line, which has been transformed with a vector containing a DNA sequence coding for expression of a novel hIL-3 mutant polypeptide. Suitable cells or cell lines may be bacterial cells. For example, the various strains of E. coli are well-known as host cells in the field of biotechnology. Examples of such strains include E. coli strains JM101 [Yanish-Perron, et al. (1985)] and MON105 [Obukowicz, et al. (1992)]. Various strains of B. subtilis may also be employed in this method. Many strains of yeast cells known to those skilled in the art are also available as host cells for expression of the polypeptides of the present invention.

Also suitable for use in the present invention are mammalian cells, such as Chinese hamster ovary cells (CHO). General methods for expression of foreign genes in mammalian cells are reviewed in: Kaufman, R. J. (1987) High level production of proteins in mammalian cells, in Genetic Engineering,

Principles and Methods, Vol. 9, J. K. Setlow, editor, Plenum Press, New York. An expression vector is constructed in which a strong promoter capable of functioning in mammalian cells drives transcription of a eukaryotic secretion signal peptide coding region, which is translationally fused to the coding region for the hIL-3 variant. For example, plasmids such as pcDNA I/Neo, pRc/RSV, and pRc/CMV (obtained from Invitrogen Corp., San Diego, California) can be used. The eukaryotic secretion signal peptide coding region 10 can be from the hIL-3 gene itself or it can be from another secreted mammalian protein (Bayne, M. L. et al. (1987) Proc. Natl. Acad. Sci. USA 84, 2638-2642). After construction of the vector containing the hIL-3 15 variant gene, the vector DNA is transfected into mammalian cells. Such cells can be, for example, the COS7, HeLa, BHK, CHO, or mouse L lines. The cells can be cultured, for example, in DMEM media (JRH Scientific). The hIL-3 variant secreted into the 20 media can be recovered by standard biochemical approaches following transient expression 24 - 72 hours after transfection of the cells or after establishment of stable cell lines following selection for neomycin resistance. The selection of suitable 25 mammalian host cells and methods for transformation, culture, amplification, screening and product production and purification are known in the art. See, e.g., Gething and Sambrook, Nature, 293:620-625 (1981), or alternatively, Kaufman et al, Mol. Cell. 30 Biol., 5(7):1750-1759 (1985) or Howley et al., U.S. Pat. No. 4,419,446. Another suitable mammalian cell line is the monkey COS-1 cell line. A similarly useful mammalian cell line is the CV-1 cell line.

Where desired, insect cells may be utilized as

host cells in the method of the present invention.

See, e.g. Miller et al, Genetic Engineering, 8:277-298

(Plenum Press 1986) and references cited therein. addition, general methods for expression of foreign genes in insect cells using Baculovirus vectors are described in: Summers, M. D. and Smith, G. E. (1987) -A manual of methods for Baculovirus vectors and insect cell culture procedures, Texas Agricultural Experiment Station Bulletin No. 1555. An expression vector is constructed comprising a Baculovirus transfer vector, in which a strong Baculovirus promoter (such as the 10 polyhedron promoter) drives transcription of a eukaryotic secretion signal peptide coding region, which is translationally fused to the coding region for the hIL-3 variant polypeptide. For example, the plasmid pVL1392 (obtained from Invitrogen Corp., San 15 Diego, California) can be used. After construction of the vector carrying the hIL-3 variant gene, two micrograms of this DNA is cotransfected with one microgram of Baculovirus DNA (see Summers & Smith, 1987) into insect cells, strain SF9. Pure recombinant 20 Baculovirus carrying the hIL-3 variant is used to infect cells cultured, for example, in Excell 401 serum-free medium (JRH Biosciences, Lenexa, Kansas). The hIL-3 variant secreted into the medium can be recovered by standard biochemical approaches.

Another aspect of the present invention provides plasmid DNA vectors for use in the method of expression of these novel hIL-3 muteins. These vectors contain the novel DNA sequences described above which code for the novel polypeptides of the invention. Appropriate vectors which can transform microorganisms capable of expressing the hIL-3 muteins include expression vectors comprising nucleotide sequences coding for the hIL-3 muteins joined to transcriptional and translational regulatory sequences which are selected according to the host cells used.

25

30

35

Vectors incorporating modified sequences as

described above are included in the present invention and are useful in the production of the hIL-3 mutant polypeptides. The vector employed in the method also contains selected regulatory sequences in operative association with the DNA coding sequences of the invention and capable of directing the replication and expression thereof in selected host cells.

Additional details may be found in co-filed United States Patent Application Attorney docket number 2713/1, which is hereby incorporated by reference in its entirety.

All references, patents or applications cited herein are incorporated by reference in their entirety.

15

20

25

30

35

10

The present invention also includes the construction and expression of (15-125) human interleukin-3 muteins having four or more amino acid substitutions in secretion vectors that optimize accumulation of correctly folded, active polypeptide. While many heterologous proteins have been secreted in E. coli there is still a great deal of unpredictability and limited success (Stader and Silhavy 1990). Full-length hIL-3 is such a protein, where attempts to secrete the protein in E. coli resulted in low secretion levels. Secretion of the variant (15-125) hIL-3 mutant polypeptides of the present invention as a fusion with a signal peptide such as LamB results in correctly folded protein that can be removed from the periplasm of E. coli by osmotic shock fractionation. This property of the variant (15-125) hIL-3 muteins allows for the direct and rapid screening for bioactivity of the secreted material in the crude osmotic shock fraction, which is a significant advantage. Furthermore, it provides a means of using the (15-125) hIL-3 muteins to conduct

structure activity relationship (SAR) studies of the hIL-3 molecule. A further advantage of secretion of (15-125) hIL-3 muteins fused to the LamB signal peptide is that the secreted polypeptide has the correct N-terminal amino acid (Asn) due to the precise nature of the cleavage of the signal peptide by signal peptidase, as part of the secretion process.

The $(15-125)\,\mathrm{hIL}{-3}$ muteins of the present invention may include hIL-3 polypeptides having Met-, Ala- or Met-Ala- attached to the N-terminus. When the muteins are expressed in the cytoplasm of E. coli, polypeptides with and without Met attached to the N-terminus are obtained. The methionine can in some cases be removed by methionine aminopeptidase.

10

30

35

Amino terminal sequences of hIL-3 muteins made in \underline{E} . $\underline{\operatorname{coli}}$ were determined using the method described by Hunkapillar et al., (1983). It was found that hIL-3 proteins made in \underline{E} . $\underline{\operatorname{coli}}$ from genes encoding Met-(15-125)hIL-3 were isolated as Met-(15-125) hIL-3.

Proteins produced from genes encoding Met-Ala-(15-125) hIL-3 were produced as Ala-(15-125) hIL-3. The N-termini of proteins made in the cytoplasm of <u>E</u>. <u>coli</u> are affected by posttranslational processing by methionine aminopeptidase (Ben-Bassat et al., 1987) and possibly by other peptidases.

One method of creating the preferred hIL-3 (15-125) mutant genes is cassette mutagenesis [Wells, et al. (1985)] in which a portion of the coding sequence of hIL-3 in a plasmid is replaced with synthetic oligonucleotides that encode the desired amino acid substitutions in a portion of the gene between two restriction sites. In a similar manner amino acid substitutions could be made in the full-length hIL-3 gene, or genes encoding variants of hIL-3 in which from 1 to 14 amino acids have been deleted from the N-terminus and/or from 1 to 15 amino acids have been

deleted from the C-terminus. When properly assembled these oligonucleotides would encode hIL-3 variants with the desired amino acid substitutions and/or deletions from the N-terminus and/or C-terminus.

5 These and other mutations could be created by those skilled in the art by other mutagenesis methods including; oligonucleotide-directed mutagenesis [Zoller and Smith (1982, 1983, 1984), Smith (1985), Kunkel (1985), Taylor, et al. (1985), Deng and Nickoloff (1992)] or polymerase chain reaction (PCR)

Nickoloff (1992)] or polymerase chain reaction (PCR) techniques [Saiki, (1985)].

15

20

Pairs of complementary synthetic oligonucleotides encoding portions of the amino terminus of the hIL-3 gene can be made and annealed to each other. Such pairs would have protruding ends compatible with ligation to NcoI at one end. The NcoI site would include the codon for the initiator methionine. At the other end of oligonucleotide pairs, the protruding (or blunt) ends would be compatible with a restriction site that occurs within the coding sequence of the hIL-3 gene. The DNA sequence of the oligonucleotide would encode sequence for amino acids of hIL-3 with the exception of those substituted and/or deleted from the sequence.

The NcoI enzyme and the other restriction enzymes chosen should have recognition sites that occur only once in the DNA of the plasmid chosen. Plasmid DNA can be treated with the chosen restriction endonucleases then ligated to the annealed oligonucleotides. The ligated mixtures can be used to transform competent JM101 cells to resistance to an appropriate antibiotic. Single colonies can be picked and the plasmid DNA examined by restriction analysis and/or DNA sequencing to identify plasmids with mutant hIL-3 genes.

One example of a restriction enzyme which cleaves

within the coding sequence of the hIL-3 gene is ClaI whose recognition site is at codons 20 and 21. use of ClaI to cleave the sequence of hIL-3 requires that the plasmid DNA be isolated from an E. coli strain that fails to methylate adenines in the DNA at GATC recognition sites. This is because the recognition site for ClaI, ATCGAT, occurs within the sequence GATCGAT which occurs at codons 19, 20 and 21 in the hIL-3 gene. The A in the GATC sequence is 10 methylated in most E. coli host cells. methylation prevents ClaI from cleaving at that particular sequence. An example of a strain that does not methylate adenines is GM48. Interpretation of activity of single amino acid mutants in IL-3 (15-125) 15

As illustrated in Tables 6 and 9, there are certain positions in the IL-3 (15-125) molecule which are intolerant of substitutions, in that most or all substitutions at these positions resulted in a 20 considerable decrease in bioactivity. There are two likely classes of such "down-mutations": mutations that affect overall protein structure, and mutations that interfere directly with the interaction between 25 the IL-3 molecule and its receptor. Mutations affecting the three-dimensional structure of the protein will generally lie in the interior of the protein, while mutations affecting receptor binding will generally lie on the surface of the protein. 30 Although the three-dimensional structure of IL-3 is unknown, there are simple algorithms which can aid in the prediction of the structure. One such algorithm is the use of "helical wheels" (Kaiser, E.T. & Kezdy, F.J., Science, 223:249-255 (1984)). In this method, 35 the presence of alpha helical protein structures can

be predicted by virtue of their amphipathic nature.

Helices in globular proteins commonly have an exposed hydrophilic side and a buried hydrophobic side. As a broad generalization, in globular proteins, hydrophobic residues are present in the interior of the protein, and hydrophilic residues are present on the surface. By displaying the amino acid sequence of a protein on such a "helical wheel" it is possible to derive a model for which amino acids in alpha helices are exposed and which are buried in the core of the protein. Such an analysis of the IL-3 (15-125) molecule predicts that the following helical residues are buried in the core:

M19, I20, I23, I24, L27, L58, F61, A64, L68, A71, I74, I77, L78, L81, W104, F107, L111, Y114, L115, L118.

In addition, cysteine residues at positions 16 and 84 are linked by a disulfide bond, which is important for the overall structure or "folding" of 20 the protein. Finally, mutations which result in a major disruption of the protein structure may be expressed at low level in the secretion system used in our study, for a variety of reasons: either because 25 the mis-folded protein is poorly recognized by the secretion machinery of the cell; because mis-folding of the protein results in aggregation, and hence the protein cannot be readily extracted from the cells; or because the mis-folded protein is more susceptible to 30 degradation by cellular proteases. Hence, a block in secretion may indicate which positions in the IL-3 molecule which are important for maintenance of correct protein structure.

In order to retain the activity of a variant of IL-3, it is necessary to retain both the structural

57

integrity of the protein, and retain the specific residues important for receptor contact. Hence it is possible to define specific amino acid residues in IL-3 (15-125) which must be retained in order to preserve biological activity.

Residues predicted to be important for interaction with the receptor: D21, E22, E43, D44, L48, R54, R94, D103, K110, F113.

10

Residues predicted to be structurally important: C16, L58, F61, A64, I74, L78, L81, C84, P86, P92, P96, F107, L111, L115, L118.

15

The hIL-3 muteins of the present invention may be useful in the treatment of diseases characterized by a decreased levels of either myeloid, erythroid, lymphoid, or megakaryocyte cells of the hematopoietic system or combinations thereof. In addition, they may be used to activate mature myeloid and/or lymphoid cells. Among conditions susceptible to treatment with the polypeptides of the present invention is leukopenia, a reduction in the number of circulating leukocytes (white cells) in the peripheral blood. 10 Leukopenia may be induced by exposure to certain viruses or to radiation. It is often a side effect of various forms of cancer therapy, e.g., exposure to chemotherapeutic drugs and of infection or hemorrhage. Therapeutic treatment of leukopenia with these hIL-3 15 mutant polypeptides of the present invention may avoid undesirable side effects caused by treatment with presently available drugs.

The hIL-3 muteins of the present invention may be *

20 useful in the treatment of neutropenia and, for
example, in the treatment of such conditions as
aplastic anemia, cyclic neutropenia, idiopathic
neutropenia, Chediak-Higashi syndrome, systemic lupus
erythematosus (SLE), leukemia, myelodysplastic

25 syndrome and myelofibrosis.

Many drugs may cause bone marrow suppression or hematopoietic deficiencies. Examples of such drugs are AZT, DDI, alkylating agents and anti-metabolites used in chemotherapy, antibiotics such as chloramphenicol, penicillin and sulfa drugs, phenothiazones, tranquilizers such as meprobamate, and diuretics. The hIL-3 muteins of the present invention may be useful in preventing or treating the bone marrow suppression or hematopoietic deficiencies which often occur in patients treated with these drugs.

30

35

Hematopoietic deficiencies may also occur as a

result of viral, microbial or parasitic infections and as a result of treatment for renal disease or renal failure, e.g., dialysis. The hIL-3 muteins of the present invention may be useful in treating such hematopoietic deficiency.

The treatment of hematopoietic deficiency may include administration of the hIL-3 mutein of a pharmaceutical composition containing the hIL-3 mutein to a patient. The hIL-3 muteins of the present invention may also be useful for the activation and amplification of hematopoietic precursor cells by treating these cells in vitro with the muteins of the present invention prior to injecting the cells into a patient.

10

35

15 Various immunodeficiencies e.g., in T and/or B lymphocytes, or immune disorders, e.g., rheumatoid arthritis, may also be beneficially affected by treatment with the hIL-3 mutant polypeptides of the present invention. Immunodeficiencies may be the 20 result of viral infections e.g. HTLVI, HTLVII, HTLVIII, severe exposure to radiation, cancer therapy or the result of other medical treatment. The hIL-3 mutant polypeptides of the present invention may also be employed, alone or in combination with other 25 hematopoietins, in the treatment of other blood cell deficiencies, including thrombocytopenia (platelet deficiency), or anemia. Other uses for these novel polypeptides are in the treatment of patients. recovering from bone marrow transplants in vivo and ex vivo, and in the development of monoclonal and 30 polyclonal antibodies generated by standard methods for diagnostic or therapeutic use.

Other aspects of the present invention are methods and therapeutic compositions for treating the conditions referred to above. Such compositions comprise a therapeutically effective amount of one or

more of the hIL-3 muteins of the present invention in a mixture with a pharmaceutically acceptable carrier. This composition can be administered either parenterally, intravenously or subcutaneously. When administered, the therapeutic composition for use in this invention is preferably in the form of a pyrogenfree, parenterally acceptable aqueous solution. The preparation of such a parenterally acceptable protein solution, having due regard to pH, isotonicity, stability and the like, is within the skill of the art.

10

15

20

25

30

35

The dosage regimen involved in a method for treating the above-described conditions will be determined by the attending physician considering various factors which modify the action of drugs, e.g. the condition, body weight, sex and diet of the patient, the severity of any infection, time of administration and other clinical factors. Generally, a daily regimen may be in the range of $0.2 - 150 \,\mu\text{g/kg}$ of non-glycosylated IL-3 protein per kilogram of body weight. This dosage regimen is referenced to a standard level of biological activity which recognizes that native IL-3 generally possesses an EC50 at or about 10 picoMolar to 100 picoMolar in the AML proliferation assay described herein. Therefore, dosages would be adjusted relative to the activity of a given mutein vs. the activity of native (reference) IL-3 and it would not be unreasonable to note that dosage regimens may include doses as low as 0.1 microgram and as high as 1 milligram per kilogram of body weight per day. In addition, there may exist specific circumstances where dosages of IL-3 mutein would be adjusted higher or lower than the range of 10 - 200 micrograms per kilogram of body weight. include co-administration with other CSF or growth factors; co-administration with chemotherapeutic drugs and/or radiation; the use of glycosylated IL-3 mutein; and various patient-related issues mentioned earlier in this section. As indicated above, the therapeutic method and compositions may also include co-

- administration with other human factors. A nonexclusive list of other appropriate hematopoietins, CSFs and interleukins for simultaneous or serial coadministration with the polypeptides of the present invention includes GM-CSF, CSF-1, G-CSF, Meg-CSF, M-
- 10 CSF, erythropoietin (EPO), IL-1, IL-4, IL-2, IL-5, IL-6, IL-7, IL-8, IL-9, IL-10, IL-11, LIF, B-cell growth factor, B-cell differentiation factor and eosinophil differentiation factor, stem cell factor (SCF) also known as steel factor or c-kit ligand, or combinations
- thereof. The dosage recited above would be adjusted to compensate for such additional components in the therapeutic composition. Progress of the treated patient can be monitored by periodic assessment of the hematological profile, e.g., differential cell count and the like.

Materials and methods for hIL-3 Mutein Expression in E. coli

Unless noted otherwise, all specialty chemicals were obtained from Sigma Co., (St. Louis, MO).

Restriction endonucleases, T4 poly-nucleotides kinase, \underline{E} . \underline{coli} DNA polymerase I large fragment (Klenow) and T4 DNA ligase were obtained from New England Biolabs (Beverly, Massachusetts).

Escherichia coli strains

- Strain JM101: delta (pro lac), supE, thi,
 F'(traD36, rpoAB, lacI-Q, lacZdeltaM15) (Messing,
 1979). This strain can be obtained from the American
 Type Culture Collection (ATCC), 12301 Parklawn Drive,
 Rockville, Maryland 20852, accession number 33876.
- MON 105 (W3110 rpoH358) is a derivative of W3110 (Bachmann, 1972) and has been assigned ATCC accession

number 55204. Strain GM48: dam-3, dcm-6, gal, ara, lac, thr, leu, tonA, tsx (Marinus, 1973) was used to make plasmid DNA that is not methylated at the sequence GATC.

5 Genes and plasmids

25

30

35

The gene used for hIL-3 production in \underline{E} . \underline{coli} was obtained from British Biotechnology Incorporated, Cambridge, England, catalogue number BBG14. This gene is carried on a pUC based plasmid designated pP0518.

The plasmids used for production of hIL-3 in

E. coli contain genetic elements whose use has been described (Olins et al., 1988; Olins and Rangwala, 1990). The replicon used is that of pBR327 (Covarrubias, et al., 1981) which is maintained at a copy number of about 100 in the cell (Soberon et al., 1980). A gene encoding the beta-lactamase protein is present on the plasmids. This protein confers ampicillin resistance on the cell. This resistance serves as a selectable phenotype for the presence of the plasmid in the cell.

For cytoplasmic expression vectors the transcription promoter was derived from the recA gene of \underline{E} . $\underline{\operatorname{coli}}$ (Sancar et al., 1980). This promoter, designated precA, includes the RNA polymerase binding site and the lexA repressor binding site (the operator). This segment of DNA provides high level transcription that is regulated even when the recA promoter is on a plasmid with the pBR327 origin of replication (Olins et al., 1988) incorporated herein by reference.

In secretion expression plasmids the transcription promoter was derived from the ara B, A, and D genes of E. coli (Greenfield et al., 1978).

This promoter is designated pAraBAD and is contained on a 323 base pair SacII, BglII restriction fragment.

The LamB secretion leader (Wong et al., 1988, Clement

et al., 1981) was fused to the N-terminus of the hIL-3 gene at the recognition sequence for the enzyme NcoI (5'CCATGG3'). The hIL-3 genes used were engineered to have a HindIII recognition site (5'AAGCTT3') following the coding sequence of the gene.

These hIL-3 variants were expressed as a fusion with the LamB signal peptide shown in Figure 8, operatively joined to the araBAD promoter (Greenfield, 1978) and the g10-L ribosome binding site (Olins et 10 al. 1988). The processed form was selectively released from the periplasm by osmotic shock as a correctly folded and fully active molecule. Secretion of (15-125) hIL-3 was further optimized by using low inducer (arabinose) concentration and by growth at 30°C. These conditions resulted in lower 15 accumulation levels of unprocessed LamB signal peptide (15-125) hIL-3 fusion, maximal accumulation levels of processed (15-125) hIL-3 and selective release of (15-125) hIL-3 by osmotic shock fractionation. The use of 20 a tightly regulated promoter such as araBAD from which the transcription level and hence the expression level can be modulated allowed for the optimization of secretion of (15-125) hIL-3.

The ribosome binding site used is that from 25 gene 10 of phage T7 (Olins et al., 1988). This is encoded in a 100 base pair (bp) fragment placed adjacent to precA. In the plasmids used herein, the recognition sequence for the enzyme NcoI (CCATGG) follows the g10-L. It is at this NcoI site that the 30 hIL-3 genes are joined to the plasmid. It is expected that the nucleotide sequence at this junction will be recognized in mRNA as a functional start site for translation (Olins et al., 1988). The hIL-3 genes used were engineered to have a HindIII recognition 35 site (AAGCTT) downstream from the coding sequence of the gene. At this HindIII site is a 514 base pair

RsaI fragment containing the origin of replication of the single stranded phage f1 (Dente et al., 1983; Olins, et al., 1990) both incorporated herein by reference. A plasmid containing these elements is pMON2341. Another plasmid containing these elements is pMON5847 which has been deposited at the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 under the accession number ATCC 68912.

10 Synthesis of Oligonucleotides

15

20

25

30

35

Oligonucleotides were synthesized on Nucleotide Synthesizer model 380A or 380B from Applied Biosystems, Inc. (Foster City, California).
Oligonucleotides were purified by polyacrylamide gel electrophoresis at concentrations from 12 - 20% (19:1 crosslinked) in 0.5 x Tris borate buffer (0.045 M Tris, 0.045 M boric acid, 1.25 mM EDTA) followed by passage through a Nensorb column obtained from New England Nuclear (Boston, Massachusetts) using a PREP Automated Sample Processor obtained from DuPont, Co. (Wilmington, Delaware).

Quantitation of synthetic oligonucleotides

Synthetic oligonucleotides were resuspended in water and quantitated by reading the absorbance at 260nm on a Beckman DU40 Spectrophotometer (Irvine, California) using a one centimeter by one millimeter quartz cuvette (Maniatis, 1982). The concentration was determined using an extinction coefficient of 1 X 104 (Voet et al., 1963; Mahler and Cordes, 1966). The oligonucleotides were then diluted to a desired concentration.

Quantitation of synthetic DNA fragments can also be achieved by adding 10 to 100 picomoles of DNA to a solution containing kinase buffer (25 mM Tris pH 8.0, 10 mM MgCl_2 , 10 mM DTT and 2 mM spermidine). To the reaction mix is added ATP to 20 micromolar, ATP

luuyalla lubesua

radiolabeled at the gamma phosphate (5000-10,0000 dpm/pmol) and 5 units of T4 polynucleotide kinase. Radiolabelled material is obtained from New England Nuclear (Boston, Massachusetts). The 10 microliter mixture is incubated at 37°C for one hour. A 1 microliter aliquot of the mixture was chromatographed on DEAE paper (Whatman) in 0.3 M ammonium bicarbonate. The counts that remained at the origin were used to determine the concentration of the synthetic DNA.

Recombinant DNA methods

10

15

20

25

30

35

Isolation of plasmid DNA from \underline{E} . $\underline{\operatorname{coli}}$ cultures was performed as described (Birnboim and Doly, 1979). Some DNAs were purified by Magic^m columns, available from Promega (Madison, Wisconsin).

Purified plasmid DNA was treated with restriction endonucleases according to manufacturer's instructions. Analysis of the DNA fragments produced by treatment with restriction enzymes was done by agarose or polyacrylamide gel electrophoresis.

Agarose (DNA grade from Fisher, Pittsburgh PA.) was used at a concentration of 1.0% in a Tris-acetate running buffer (0.04 M Tris-acetate, 0.001M EDTA).

Polyacrylamide (BioRad, Richmond CA.) was used at a concentration of 6% (19:1 crosslinked) in 0.5 X Tris-borate buffer (0.045 M Tris, 0.045 M boric acid, 1.25 mM EDTA), hereafter referred to as PAGE.

DNA polymerase I, large fragment, Klenow enzyme was used according to manufacturers instructions to catalyze the addition of mononucleotides from 5' to 3' of DNA fragments which had been treated with restriction enzymes that leave protruding ends. The reactions were incubated at 65°C for 10 minutes to heat inactivate the Klenow enzyme.

The synthetic oligonucleotides were made without 5' or 3' terminal phosphates. In cases where such

oligonucleotides were ligated end to end, the oligonucleotides were treated at a concentration of 10 picomoles per microliter with T4 polynucleotide kinase in the following buffer: 25 mM Tris, pH 8.0, 10 mM MgCl₂, 10 mM dithiothreitol, 2 mM spermidine, 1 mM rATP. After incubation for 30 minutes at 37°C, the samples were incubated at 65°C for five minutes to heat inactivate the kinase.

Synthetic gene assembly

35

The (15-125) hIL-3 gene was divided into four 10 regions separated by five convenient restriction sites. In each of the four regions synthetic oligonucleotides were designed so that they would anneal in complementary pairs, with protruding single stranded ends, and when the pairs were properly 15 assembled would result in a DNA sequence that encoded a portion of the hIL-3 gene. Amino acid substitutions in the hIL-3 gene were made by designing the oligonucleotides to encode the desired substitutions. 20 The complementary oligonucleotides were annealed at concentration of 1 picomole per microliter in ligation buffer plus 50mM NaCl. The samples were heated in a 100 ml beaker of boiling water and permitted to cool slowly to room temperature. One picomole of each of 25 the annealed pairs of oligonucleotides were ligated with approximately 0.2 picomoles of plasmid DNA, digested with the appropriate restriction enzymes, in ligation buffer (25 mM Tris pH 8.0, 10 mM MgCl₂, 10 mM dithiothreitol, 1 mM ATP, 2mM spermidine) with T4 DNA 30 ligase obtained from New England Biolabs (Beverly, Massachusetts) in a total volume of 20 µl at room temperature overnight.

DNA fragments were isolated from agarose gels by intercepting the restriction fragments on DEAE membranes from Schleicher and Schuell (Keene, New Hampshire) and eluting the DNA in 10 mM Tris, 1 mM

EDTA, 1 M NaCl at 55°C for 1 hour, according to manufacturer's directions. The solutions containing the DNA fragment were concentrated and desalted by using Centricon 30 concentrators from Amicon (W.R. Grace, Beverly MA.) according to the manufacturer's directions. Ligations were performed at 15°C overnight, except as noted, in ligation buffer.

Polymerase Chain Reaction

10 Polymerase Chain Reaction (hereafter referred to as PCR) techniques (Saiki, 1985) used the reagent kit and thermal cycler from Perkin-Elmer Cetus (Norwalk, CT.). PCR is based on a thermostable DNA polymerase from Thermus aquaticus. The PCR technique is a DNA amplification method that mimics the natural DNA 15 replication process in that the number of DNA molecules doubles after each cycle, in a way similar to in vivo replication. The DNA polymerase mediated extension is in a 5' to 3' direction. The term 20 "primer" as used herein refers to an oligonucleotide sequence that provides an end to which the DNA polymerase can add nucleotides that are complementary to a nucleotide sequence. The latter nucleotide sequence is referred to as the "template", to which the primers are annealed. The amplified PCR product is 25 defined as the region comprised between the 5' ends of the extension primers. Since the primers have defined sequences, the product will have discrete ends, corresponding to the primer sequences. The primer 30 extension reaction was carried out using 20 picomoles (pmoles) of each of the oligonucleotides and 1 picogram of template plasmid DNA for 35 cycles (1 cycle is defined as 94 degrees C for one minute, 50 degrees C for two minutes and 72 degrees for three minutes.). The reaction mixture was extracted with an 35 equal volume of phenol/chloroform (50% phenol and 50%

chloroform, volume to volume) to remove proteins. The aqueous phase, containing the amplified DNA, and solvent phase were separated by centrifugation for 5 minutes in a microcentrifuge (Model 5414 Eppendorf Inc, Fremont CA.). To precipitate the amplified DNA the aqueous phase was removed and transferred to a fresh tube to which was added 1/10 volume of 3M NaOAc (pH 5.2) and 2.5 volumes of ethanol (100% stored at minus 20 degrees C). The solution was mixed and placed 10 on dry ice for 20 minutes. The DNA was pelleted by centrifugation for 10 minutes in a microcentrifuge and the solution was removed from the pellet. The DNA pellet was washed with 70% ethanol, ethanol removed and dried in a speedvac concentrator (Savant, Farmingdale, New York). The pellet was resuspended in 15 25 microliters of TE (20mM Tris-HCl pH 7.9, 1mM EDTA). Alternatively the DNA was precipitated by adding equal volume of 4M NH4OAc and one volume of isopropanol [Treco et al., (1988)]. The solution was mixed and 20 incubated at room temperature for 10 minutes and centrifuged. These conditions selectively precipitate DNA fragments larger than ~ 20 bases and were used to remove oligonucleotide primers. One quarter of the reaction was digested with restriction enzymes 25 [Higuchi, (1989)] an on completion heated to 70 degrees C to inactivate the enzymes.

Recovery of recombinant plasmids from ligation mixes

E. coli JM101 cells were made competent to take up DNA. Typically, 20 to 100 ml of cells were grown in LB medium to a density of approximately 150 Klett units and then collected by centrifugation. The cells were resuspended in one half culture volume of 50 mM CaCl₂ and held at 4°C for one hour. The cells were again collected by centrifugation and resuspended in

one tenth culture volume of 50 mM CaCl2.

added to a 150 microliter volume of these cells, and the samples were held at 4°C for 30 minutes. The samples were shifted to 42°C for one minute, one milliliter of LB was added, and the samples were shaken at 37°C for one hour. Cells from these samples were spread on plates containing ampicillin to select for transformants. The plates were incubated overnight at 37°C. Single colonies were picked, grown in LB supplemented with ampicillin overnight at 37°C with shaking. From these cultures DNA was isolated for restriction analysis.

Culture medium

LB medium (Maniatis et al., 1982) was used for growth of cells for DNA isolation. M9 minimal medium 15 supplemented with 1.0% casamino acids, acid hydrolyzed casein, Difco (Detroit, Michigan) was used for cultures in which recombinant hIL-3 was produced. ingredients in the M9 medium were as follows: 20 $3g/liter KH_2PO_4$, $6g/l Na_2HPO_4$, 0.5 g/l NaCl, 1 g/l NH4Cl, 1.2 mM MgSO4, 0.025 mM CaCl2, 0.2% glucose (0.2% glycerol with the AraBAD promoter), 1% casamino acids, 0.1 ml/l trace minerals (per liter 108 g FeCl3.6H2O, 4.0 g ZnSO4.7H2O, 7.0 CoCl2.2H2O, 7.0 g 25 $Na_2MoO_4 \cdot 2H_2O$, 8.0 g $CuSO_4 \cdot 5H_2O$, 2.0 g H_3BO_3 , 5.0 g MnSO4·H2O, 100 ml concentrated HCl). Bacto agar was used for solid media and ampicillin was added to both liquid and solid LB media at 200 micrograms per milliliter.

30

35

10

DNA sequence analysis

The nucleotide sequencing of plasmid DNA was determined using a Genesis 2000 sequencer obtained from DuPont (Wilmington, Delaware) according to the methods of Prober et al. (1987) and Sanger et al. (1977). Some DNA sequences were performed using

Sequenase $^{\text{m}}$ polymerase (U.S. Biochemicals, Cleveland, Ohio) according to manufacturer's directions.

Production of recombinant hIL-3 muteins in E. coli with vectors employing the recA promoter

- $\underline{\text{E. coli}}$ strains harboring the plasmids of interest were grown at 37°C in M9 plus casamino acids medium with shaking in a Gyrotory water bath Model G76 from New Brunswick Scientific (Edison, New Jersey).
- 10 Growth was monitored with a Klett Summerson meter (green 54 filter), Klett Mfg. Co. (New York, New York). At a Klett value of approximately 150, an aliquot of the culture (usually one milliliter) was removed for protein analysis. To the remaining
- culture, nalidixic acid (10mg/ml) in 0.1 N NaOH was added to a final concentration of 50 μ g/ml. The cultures were shaken at 37°C for three to four hours after addition of nalidixic acid. A high degree of aeration was maintained throughout the bacterial
- growth in order to achieve maximal production of the desired gene product. The cells were examined under a light microscope for the presence of refractile bodies (RBs). One milliliter aliquots of the culture were removed for analysis of protein content.
- 25 Production of recombinant hIL-3 proteins from the pAraBAD promoter in E. coli
 - $E.\ coli$ strains harboring the plasmids of interest were grown at 30°C with shaking in M9 medium plus casamino acids and glycerol. Growth was
- 30 monitored with a Klett Summerson colorimeter, using a green 54 filter. At a Klett value of about 150, an aliquot of the culture (usually one milliliter) was removed for protein analysis. To the remaining culture, 20% arabinose was added to a final
- 35 concentration of 0.05%. The cultures were shaken at 30°C for three to four hours after addition of

arabinose. A high degree of aeration was maintained throughout the bacterial growth in order to achieve maximal production of the desired gene product. One milliliter aliquots of the culture were removed for analysis of protein content.

Secretion and osmotic shock

Three hour post induction samples were fractionated by osmotic shock [Neu and Heppel (1965)]. The optical density (Klett value) of the cultures was determined and 1 ml of cells were centrifuged in a 10 Sigma microcentrifuge (West Germany) model 202MK in 1.5 mls snap top microcentrifuge tubes for 5 minutes at 10,000 rpm. The cell pellet was resuspended very gently by pipeting in a room temperature sucrose solution (20% sucrose w/v, 30mM Tris-Hcl pH7.5, 1mM 15 EDTA), using 1µ1/1 Klett unit. Following a 10 minute incubation at room temperature, the cells were centrifuged for 5 minutes at 10,000 rpm. The sucrose fraction was carefully removed from the cell pellet. 20 The cell pellet was then resuspended very gently by pipeting in ice cold distilled water, using 1µ1/1 Klett unit. Following a 10 minute incubation on ice, the cells were centrifuged for 5 minutes at 12,000 rpm. The water fraction was carefully removed. Equal 25 volumes of the sucrose and water fractions were pooled and aliquoted to provide samples for activity screening.

Analysis of protein content of E. coli cultures producing hIL-3 mutant polypeptides

30

35

Bacterial cells from cultures treated as described above were collected from the medium by centrifugation. Aliquots of these cells were resuspended in SDS loading buffer (4X: 6 g SDS, 10 ml beta-mercaptoethanol, 25 ml upper Tris gel stock (0.5 M Tris HCl pH 6.8, 0.4% SDS) brought to 50 ml with glycerol, 0.2% bromophenol blue was added) at a

concentration of one microliter per Klett unit. samples were incubated at 85°C for five minutes and vortexed. Five or ten microliter aliquots of these samples were loaded on 15% polyacrylamide gels prepared according to the method of Laemmli (1970). Protein bands were visualized by staining the gels with a solution of acetic acid, methanol and water at 5:1:5 ratio (volume to volume) to which Coomassie blue had been added to a final concentration of 1%. After 10 staining, the gels were washed in the same solution without the Coomassie blue and then washed with a solution of 7% acetic acid, 5% methanol. Gels were dried on a gel drier Model SE1160 obtained from Hoeffer (San Francisco, California). The amount of stained protein was measured using a densitometer 15 obtained from Joyce-Loebl (Gateshead, England). values obtained were a measure of the amount of the stained hIL-3 protein compared to the total of the stained protein of the bacterial cells.

Western blot analysis of hIL-3 muteins made in E. coli 20 In some E. coli cultures producing hIL-3, the level of accumulation of the hIL-3 protein is lower than 5% of total bacterial protein. To detect hIL-3 produced at this level, Western blot analysis was 25 used. Proteins from cultures induced with nalidixic acid or arabinose were run on polyacrylamide gels as described above except that volumes of sample loaded were adjusted to produce appropriate signals. electrophoresis, the proteins were electroblotted to 30 APT paper, Transa-bind, Schleicher and Schuell (Keene, New Hampshire) according to the method of Renart et al. (1979). Antisera used to probe these blots had been raised in rabbits, using peptides of the sequence of amino acids 20 to 41 and 94 to 118 of hIL-3 as the 35 immunogens. The presence of bound antibody was detected with Staphylococcal protein A radiolabeled

with 125 I, obtained from New England Nuclear (Boston, Massachusetts).

Fractionation of E. coli cells producing hIL-3 proteins in the cytoplasm

Cells from E. coli cultures harboring plasmids 5 that produce hIL-3 muteins were induced with nalidixic acid. After three hours, the hIL-3 muteins accumulated in refractile bodies. The first step in purification of the hIL-3 muteins was to sonicate 10 cells. Aliquots of the culture were resuspended from cell pellets in sonication buffer: 10 mM Tris, pH 8.0, 1 mM EDTA, 50 mM NaCl and 0.1 mM PMSF. resuspended cells were subjected to several repeated sonication bursts using the microtip from a Sonicator cell disrupter, Model W-375 obtained from Heat 15 Systems-Ultrasonics Inc. (Farmingdale, New York). The extent of sonication was monitored by examining the homogenates under a light microscope. When nearly all of the cells had been broken, the homogenates were fractionated by centrifugation. The pellets, which 20 contain most of the refractile bodies, are highly enriched for hIL-3 muteins. Methods: Extraction, Refolding and Purification of

Methods: Extraction, Refolding and Purification of Interleukin-3 (IL-3) Muteins Expressed as Refractile Bodies in E. coli.

Extraction of refractile bodies (RB's):

25

30

35

For each gram of RB's (and typically one gram is obtained from a 300 ml E. coli culture), 5 ml of a solution containing 6M guanidine hydrochloride (GnHCl), 50 mM 2-N-cyclohexylaminoethanesulfonic acid (CHES) pH 9.5 and 20 mM dithiothreitol (DTT) was added. The RB's were extracted with a Bio-Homogenizer for 15-30 seconds and gently rocked for 2 hours at 5 degrees centigrade (5°C) to allow the protein to completely reduce and denature.

Refolding of the IL-3 muteins

The protein solution was transferred to dialysis tubing (1000 molecular weight cut-off) and dialyzed against at least 100 volumes of 4M GnHCl - 50 mM CHES pH 8.0. The dialysis was continued overnight at 5°C while gently stirring. Subsequently dialysis was continued against at least 100 volumes of 2M GnHCl - 50 mM CHES pH 8.0 and dialyzed overnight at 5°C while gently stirring.

Purification of the IL-3 muteins

10 The protein solution was removed from the dialysis tubing and acidified by the addition of 40% acetonitrile (CH3CN) - 0.2% trifluoroacetic acid (TFA) to a final concentration of 20% CH3CN - 0.1% TFA. This was centrifuged (16,000 \times g for 5 minutes) to clarify and the supernatant was loaded onto a Vydac C-15 18 reversed phase column (10x250 mm) available from Vydac (Hesperia, California) previously equilibrated in 20% CH3CN - 0.1% TFA. The column was eluted with a linear gradient (0.2% CH3CN/minute) between 40 - 50% 20 CH3CN - 0.1% TFA at a flow rate of 3 ml/minute while collecting 1.5 ml fractions. The fractions were analyzed by polyacrylamide gel electrophoresis (SDS-PAGE) and the appropriate fractions pooled. pooled material was dried by lyophilization or in a 25 Speed Vac concentrator. The dry powder was reconstituted with 10 mM ammonium bicarbonate pH 7.5, centrifuged (16,000 x g for 5 minutes) to clarify and assayed for protein concentration by the method of Bradford (1976) with bovine serum albumin as the 30 standard. Such protein can be further analyzed by additional techniques such as, SDS-PAGE, electrospray mass spectrometry, reverse phase HPLC, capillary zone electrophoresis, amino acid composition analysis, and

ELISA (enzyme-linked immunosorbent assay).

hIL-3 SANDWICH ELISA

lls lbesue

IL-3 protein concentrations can be determined using a sandwich ELISA based on an affinity purified polyclonal goat anti-rhIL-3. Microtiter plates (Dynatech Immulon II) were coated with 150 µl goatanti-rhIL-3 at a concentration of approximately 1 μg/ml in 100 mM NaHCO3, pH 8.2. Plates were incubated overnight at room temperature in a chamber maintaining 100% humidity. Wells were emptied and the remaining reactive sites on the plate were blocked with 200 μl of solution containing 10 mM PBS, 3% BSA and 0.05% 10 Tween 20, pH 7.4 for 1 hour at 37° C and 100% humidity. Wells were emptied and washed 4X with 150 mM NaCl containing 0.05% Tween 20 (wash buffer). Each well then received 150 µl of dilution buffer (10 mM PBS containing 0.1% BSA, 0.01% Tween 20, pH 7.4), 15 containing rhIL-3 standard, control, sample or dilution buffer alone. A standard curve was prepared with concentrations ranging from 0.125 ng/ml to 5 ng/ml using a stock solution of rhIL-3 (concentration-20 determined by amino acid composition analysis). Plates were incubated 2.5 hours at 37° C and 100% humidity. Wells were emptied and each plate was washed 4X with wash buffer. Each well then received 150 µl of an optimal dilution (as determined in a 25 checkerboard assay format) of goat anti-rhIL-3 conjugated to horseradish peroxidase. Plates were incubated 1.5 hours at 37°C and 100% humidity. were emptied and each plate was washed 4X with wash buffer. Each well then received 150 ul of ABTS 30 substrate solution (Kirkegaard and Perry). Plates were incubated at room temperature until the color of the standard wells containing 5 ng/ml rhIL-3 had developed enough to yield an absorbance between 0.5-1.0 when read at a test wavelength of 410 nm and a 35 reference wavelength of 570 nm on a Dynatech microtiter plate reader. Concentrations of

immunoreactive rhIL-3 in unknown samples were calculated from the standard curve using software supplied with the plate reader.

5 AML Proliferation Assay for Bioactive Human Interleukin-3

The factor-dependent cell line AML 193 was obtained from the American Type Culture Collection (ATCC, Rockville, MD). This cell line, established 10 from a patient with acute myelogenous leukemia, is a growth factor dependent cell line which displayed enhanced growth in GM/CSF supplemented medium (Lange, B., et al., (1987); Valtieri, M., et al., The ability of AML 193 cells to proliferate in the presence of human IL-3 has also been 15 documented. (Santoli, D., et al., (1987)). A cell line variant was used, AML 193 1.3, which was adapted for long term growth in IL-3 by washing out the growth factors and starving the cytokine dependent AML 193 cells for growth factors for 24 hours. The cells were 20 then replated at $1x10^5$ cells/well in a 24 well plate in media containing 100 U/ml IL-3. It took approximately 2 months for the cells to grow rapidly in IL-3. These cells were maintained as AML 193 1.3 25 thereafter by supplementing tissue culture medium (see below) with human IL-3.

AML 193 1.3 cells were washed 6 times in cold Hanks balanced salt solution (HBSS, Gibco, Grand Island, NY) by centrifuging cell suspensions at 250 x g for 10 minutes followed by decantation of supernatant. Pelleted cells were resuspended in HBSS and the procedure was repeated until six wash cycles were completed. Cells washed six times by this procedure were resuspended in tissue culture medium at a density ranging from 2 x 10^5 to 5 x 10^5 viable cells/ml. This medium was prepared by supplementing

30

Iscove's modified Dulbecco's Medium (IMDM, Hazleton, Lenexa, KS) with albumin, transferrin, lipids and 2-mercaptoethanol. Bovine albumin (Boehringer-Mannheim, Indianapolis, IN) was added at 500 μ g/ml; human transferrin (Boehringer-Mannheim, Indianapolis, IN) was added at 100 μ g/ml; soybean lipid (Boehringer-Mannheim, Indianapolis, IN) was added at 50 μ g/ml; and 2-mercaptoethanol (Sigma, St. Louis, MO) was added at 5 x 10-5 M.

10 Serial dilutions of human interleukin-3 or human interleukin-3 variant protein (hIL-3 mutein) were made in triplicate series in tissue culture medium supplemented as stated above in 96 well Costar 3596 tissue culture plates. Each well contained 50 µl of medium containing interleukin-3 or interleukin-3 15 variant protein once serial dilutions were completed. Control wells contained tissue culture medium alone (negative control). AML 193 1.3 cell suspensions prepared as above were added to each well by pipetting 50 μ l (2.5 x 10⁴ cells) into each well. 20 culture plates were incubated at 37°C with 5% CO2 in humidified air for 3 days. On day 3, 0.5 μ Ci 3 Hthymidine (2 Ci/mM, New England Nuclear, Boston, MA) was added in 50 μ l of tissue culture medium. were incubated at 37°C with 5% CO2 in humidified air 25 for 18-24 hours. Cellular DNA was harvested onto glass filter mats (Pharmacia LKB, Gaithersburg, MD) using a TOMTEC cell harvester (TOMTEC, Orange, CT) which utilized a water wash cycle followed by a 70% 30 ethanol wash cycle. Filter mats were allowed to air dry and then placed into sample bags to which scintillation fluid (Scintiverse II, Fisher Scientific, St. Louis, MO or BetaPlate Scintillation Fluid, Pharmacia LKB, Gaithersburg, MD) was added. 35 Beta emissions of samples from individual tissue culture wells were counted in a LKB Betaplate model

1205 scintillation counter (Pharmacia LKB, Gaithersburg, MD) and data was expressed as counts per minute of ³H-thymidine incorporated into cells from each tissue culture well. Activity of each human interleukin-3 preparation or human interleukin-3 variant preparation was quantitated by measuring cell proliferation (3H-thymidine incorporation) induced by graded concentrations of interleukin-3 or interleukin-3 variant. Typically, concentration ranges from 0.05 pM - 10^5 pM are quantitated in these assays. 10 is determined by measuring the dose of interleukin-3 or interleukin-3 variant which provides 50% of maximal proliferation $[EC50 = 0.5 \times (maximum average counts]$ per minute of ³H-thymidine incorporated per well among triplicate cultures of all concentrations of 15 interleukin-3 tested - background proliferation measured by ³H-thymidine incorporation observed in triplicate cultures lacking interleukin-3]. value is also equivalent to 1 unit of bioactivity. Every assay was performed with native interleukin-3 as 20 a reference standard so that relative activity levels could be assigned.

Relative biological activities of IL-3 muteins of the present invention are shown in Table 1. The Relative Biological Activity of IL-3 mutants is calculated by dividing the EC50 of (1-133) hIL-3 by the EC50 of the mutant. The Relative Biological Activity may be the average of replicate assays.

^{*} The Relative Biological Activity of IL-3 mutants is calculated by dividing the EC50 of (1-133) hIL-3 by the EC50 of the mutant.

The following assay is used to measure IL-3

mediated sulfidoleukotriene release from human mononuclear cells.

IL-3 mediated sulfidoleukotriene release from human mononuclear cells

Heparin-containing human blood was collected and layered onto an equal volume of Ficoll-Paque (Pharmacia # 17-0840-02) ready to use medium (density 10 1.077 g/ml.). The Ficoll was warmed to room temperature prior to use and clear 50 ml polystyrene tubes were utilized. The Ficoll gradient was spun at 300 x g for 30 minutes at room temperature using a H1000B rotor in a Sorvall RT6000B refrigerated centrifuge. The band containing the mononuclear cells 15 was carefully removed, the volume adjusted to 50 mls with Dulbecco's phosphate-buffered saline (Gibco Laboratories cat. # 310-4040PK), spun at 400 x q for 10 minutes at 4°C and the supernatant was carefully 20 removed. The cell pellet was washed twice with HA Buffer [20 mM Hepes (Sigma # H-3375), 125 mM NaCl (Fisher # S271-500), 5 mM KCl (Sigma # P-9541), 0.5 mM glucose (Sigma # G-5000), 0.025% Human Serum Albumin (Calbiochem # 126654) and spun at 300 x g, 10 min., 4°C. The cells were resuspended in HACM Buffer (HA 25 buffer supplemented with 1 mM CaCl2 (Fisher # C79-500) and 1 mM MqCl2 (Fisher # M-33) at a concentration of 1 x 106 cells/ml and 180 μ l were transferred into each well of 96 well tissue culture plates. The cells were 30 allowed to acclimate at 37°C for 15 minutes. The cells were primed by adding 10 μ ls of a 20 X stock of various concentrations of cytokine to each well (typically 100000, 20000, 4000, 800, 160, 32, 6.4, 1.28, 0 fM IL3). The cells were incubated for 15 minutes at 37°C. Sulfidoleukotriene release was 35 activated by the addition of 10 µls of 20 X (1000 nM)

fmet-leu-phe (Calbiochem # 344252) final concentration 50nM FMLP and incubated for 10 minutes at 37°C. The plates were spun at 350 x g at 4°C for 20 minutes. The supernatants were removed and assayed for sulfidoleukotrienes using Cayman's Leukotriene C4 EIA kit (Cat. #420211) according to manufacturers' directions. Native (15-125)hIL-3 was run as a standard control in each assay.

Native hIL-3 possesses considerable inflammatory activity and has been shown to stimulate synthesis of the arachidonic acid metabolites LTC4, LTD4, and LTE4; histamine synthesis and histamine release. Human clinical trials with native hIL-3 have documented inflammatory responses (Biesma, et al., BLOOD, 80:1141-1148 (1992) and Postmus, et al., J. CLIN. ONCOL., 10:1131-1140 (1992)). A recent study indicates that leukotrienes are involved in IL-3 actions in vivo and may contribute significantly to the biological effects of IL-3 treatment (Denzlinger, C., et al., BLOOD, 81:2466-2470 (1993))

Some muteins of the present invention may have an improved therapeutic profile as compared to native hIL-3 or (15-125)hIL-3. For example, some muteins of the present invention may have a similar or more potent growth factor activity relative to native hIL-3 or (15-125)hIL-3 without having a similar or corresponding increase in the stimulation of leukotriene or histamine. These muteins would be expected to have a more favorable therapeutic profile since the amount of polypeptide which needs to be given to achieve the desired growth factor activity (e. g. cell proliferation) would have a lesser leukotriene or histamine stimulating effect. In studies with native hIL-3, the stimulation of inflammatory factors has been an undesirable side

25

30

loopals office

effect of the treatment. Reduction or elimination of the stimulation of mediators of inflammation would provide an advantage over the use of native hIL-3.

The pMON13288 polypeptide has demonstrated a more potent growth factor activity relative to native hIL-3 in the AML 193 cell proliferation assay (EC50 = 0.8 -3.8 pM for pMON13288 and EC50 = 30.2 pM for native hIL-3) without demonstrating a corresponding increase in the stimulation of leukotriene C4 (LTC4) production 10 and histamine release, i. e., it stimulated LTC4 production and histamine release with a potency similar to that of native hIL-3 while having an improved ability to stimulate cell proliferation compared to native hIL-3. Thus with the pMON13288 15 polypeptide it would be expected that one would be able to produce a desired therapeutic response, e. g., cell proliferation, with less stimulation of the undesirable inflammatory mediators.

Some muteins of the present invention have antigenic profiles which differ from that of native hIL-3. For example, in a competition ELISA with an affinity purified polyclonal goat anti-hIL-3 antibody, native hIL-3 significantly blocked the binding of labeled hIL-3 to polyclonal anti-hIL-3 antibody whereas the pMON13288 polypeptide failed to block the binding of hIL-3 to anti-hIL-3 antibody.

Table 2 lists the sequences of some oligonucleotides used in making the muteins of the present invention.

Table 3 lists the amino acid sequence of native (15-125)hIL-3 (Peptide #1) and the amino acid sequences of some mutant polypeptides of the present invention. The sequences are shown with the amino acid numbering corresponding to that of native hIL-3 [FIG.

35 11.

Polypeptides corresponding to [SEQ ID NO. 129] comprising (1-133) hIL-3 containing four or more amino acid substitutions can be made using the procedures described above and in the following examples by starting with the appropriate oligonuctiotides and then constructing the DNA encoding the polypeptide and expressing it in an appropriate host cell. In a similar manner polypeptides which correspond to [SEQ ID NO. 130] and contain four or more amino acid substitutions and wherein from 1 to 14 amino acids have been sequentially deleted from the N-terminus, or from 1 to 15 amino acids have been deleted from the Cterminus or deletions of amino acids have been made from both the N-terminus and the C-terminus can also be made by following the procedures described above and in the following examples, beginning with the appropriate starting materials.

Further details known to those skilled in the art may be found in T. Maniatis, et al., Molecular
Cloning, A Laboratory Manual, Cold Spring Harbor

Laboratory (1982) and references cited therein, incorporated herein by reference; and in J. Sambrook, et al., Molecular Cloning, A Laboratory Manual, 2nd edition, Cold Spring Harbor Laboratory (1989) and references cited therein, incorporated herein by reference.

The following examples will illustrate the invention in greater detail although it will be understood that the invention is not limited to these specific examples.

Amino acids are shown herein by standard one letter or three letter abbreviations as follows:

10

15	Abbreviated	Designation	Amino Acid
	А	Ala	Alanine
	С	Cys	Cysteine
20	D	Asp	Aspartic acid
	E	Glu	Glutamic acid
	F	Phe	Phenylalanine
	Abbreviated	Designation	Amino Acid
25			
	G	Gly	Glycine
	Н	His	Histidine
	I	Ile	Isoleucine
	K	Lys	Lysine
30	${f L}$	Leu	Leucine
	М	Met	Methionine
	N	Asn	Asparagine
	P	Pro	Proline
	Q	Gln	Glutamine
35	R	Arg	Arginine
	S	Ser	Serine
	T	Thr	Threonine
	V	Val	Valine

W Trp Tryptophan Y Tyr Tyrosine

Various other examples will be apparent to the person skilled in the art after reading the present disclosure without departing from the spirit and scope of the invention. It is intended that all such other examples be included within the scope of the appended claims.

30

35

Construction of pMON 5846 (Fig. 4) which encodes [Met-(1-133)hIL-3 (Arg 129)]

A plasmid containing the gene for the cDNA of hIL-3 cloned into pUC18 on an EcoRI to HindIII fragment was obtained from British Biotechnology Limited (Cambridge, England). This plasmid was designated pPO518. The purified plasmid DNA was cleaved by the restriction endonucleases NheI and BamHI. Approximately 0.5 micrograms of cleaved plasmid DNA was ligated to 1.0 picomoles of a pair of annealed oligonucleotides with the following sequence:

5'-CTAGCGATCTTTTAATAAGCTTG-3' [SEQ ID NO: 1]
3'-GCTAGAAAATTATTCGAACCTAG-5' [SEQ ID NO: 2]

The ligation mixture was used to transform competent JM101 cells to ampicillin resistance. Colonies were picked, and plasmid DNA was purified and subjected to restriction enzyme analysis. An isolate was identified in which the above oligonucleotide sequence had replaced the portion of the gene that encodes the extreme C terminus. Within the new sequence was a new stop codon, TAA, and a recognition site for the enzyme HindIII. The new plasmid was designated pMON5846.

EXAMPLE 2

(a) <u>Construction of expression vector plasmid</u> pMON2341

5 The plasmid pMON2341 was used to supply the particular replicon and expression elements used for construction of many of the plasmids used to produce hIL-3 and hIL-3 muteins in E. coli. These expression elements are described in the materials and methods pMON2341 is derived from pMON5515 (Olins 10 et al., 1988) and from pMON2429. pMON2429 consists of the phage mp18 (Yanisch-Perron et al., 1985) with a BclI fragment carrying the chloramphenicol acetyl transferase (cat) gene from pBR328 (Covarrubias et 15 al., 1981) inserted into the BamHI site. The cat gene in pMON2429 has been altered from that in pBR328 by site directed mutagenesis (Kunkel, 1985). recognition sites for NcoI and EcoRI which occur in the native gene were altered so that these two 20 restriction enzymes no longer recognize these sites. The changes did not alter the protein specified by the gene. Also, an NcoI site was introduced at the Nterminus of the coding sequence so that it overlaps the codon for initiator methionine.

The steps involved in construction of pMON2341 are listed below:

25

30

35

(1) The DNAs of pMON5515 and pMON2429 were treated with NcoI and HindIII. The fragments were ligated and used to transform competent <u>E</u>. <u>coli</u> to ampicillin resistance. From these colonies, some were identified that were chloramphenical resistant. From one of these colonies, plasmid DNA was isolated in which the rat atriopeptigen gene of pMON5515 had been replaced by the NcoI to HindIII fragment containing the <u>cat</u> gene from pMON2429. This fragment contains the recognition sites for several restriction enzymes

in the portion derived from the multilinker region of mp18. The new plasmid was designated pMON2412.

which cleaves at one location in the pBR327 derived portion of the DNA. The protruding ends were rendered blunt by treatment with Klenow in the presence of nucleotide precursors. This DNA was mixed with an isolated 514 bp RsaI fragment derived from pEMBL8 (Dente et al., 1983). This RsaI fragment contains the origin of replication of phage f1. This ligation mixture was used to transform competent E. coli cells to ampicillin resistance. Among the plasmid DNAs isolated from these cells was pMON5578. This plasmid has the structure of pMON2412 with the f1 origin region inserted into the ClaI site. This is illustrated in the Figures and in Olins and Rangwala (1990).

10

15

- (3) The DNA of pMON5578 was treated with restriction enzymes HindIII and MstII. The DNA was then treated with Klenow enzyme in the presence of nucleotide precursors to render the ends blunt. This treated DNA was ligated and used to transform competent <u>E</u>. <u>coli</u> to ampicillin resistance. From the ampicillin resistant colonies, one plasmid was recovered from which the portion between HindIII and MstII was absent. This deletion resulted in the removal of sequences from the plasmid which are recognized by a number of restriction endonuclease sites. The new plasmid was designated pMON5582.
- 30 (4) The DNA of pMON5582 was treated with SstII and BclII and ligated in the presence of annealed oligonucleotides with the sequences shown below.
 - 5'- GGCAACAATTTCTACAAAACACTTGATACTGTATGAGCAT-
- 35 3'-CGCCGTTGTTAAAGATGTTTTGTGAACTATGACATACTCGTA-

ACAGTATAATTGCTTCAACAGAACAGATC-3' [SEQ ID NO:3]
TGTCATATTAACGAAGTTGTCTTGT-5' [SEQ ID NO:4]

This sequence encodes the essential elements of the recA promoter of <u>E</u>. <u>coli</u> including the transcription start site and the lexA repressor binding site (the operator) (Sancar et al., 1980). The plasmid recovered from the ligation mixes contained this recA promoter in place of the one in pMON5582 (and in pMON5515). The functionality of the recA promoter was illustrated by Olins and Rangwala (1990). The new plasmid was designated pMON5594.

- (5) To eliminate the single EcoRI site in pMON5594, the DNA was treated with EcoRI, then with 15 Klenow in the presence of nucleotide precursors to render the ends blunt and then the DNA was ligated. From this ligation mix a plasmid was recovered whose DNA was not cleaved with EcoRI. This plasmid was designated pMON5630.
- 20 (6) To alter the single recognition site for PstI, plasmid pMON5630 was subjected to site directed mutagensis (Kunkel, 1985). The oligonucleotide used in this procedure has the sequence shown below.
- 25 5'-CCATTGCTGCCGGCATCGTGGTC-3' [SEQ ID NO:5]

30

The result of the procedure was to construct pMON2341 which differs from pMON5630 in that the PstI site in the beta-lactamase gene was altered so that PstI no longer recognizes the site. The single nucleotide change does not alter the amino acid sequence of the beta-lactamase protein.

- (b) Construction of pMON5847 (Fig. 5) which encodes $[Met-(1-133)hIL-3(Arg^{129})]$
- Plasmid pMON2341 was used to supply the replicon, promotor, ribosome binding site, transcription

terminator and antibiotic resistance marker for the plasmids used to produce hIL-3 in \underline{E} . \underline{coli} from cDNA derived hIL-3 genes.

Plasmid pMON2341 was treated with restriction enzymes NcoI and HindIII. The restriction fragment containing the replication origin was purified. DNA of plasmid pMON5846 was treated with NcoI and HindIII. The restriction fragment containing the hIL-3 gene was gel purified. These purified restriction 10 fragments were mixed and ligated. The ligation mixture was used to transform competent JM101 cells to ampicillin resistance. Colonies were picked, and plasmid DNA was purified and analyzed using restriction enzymes. pMON5847 was identified as a plasmid with the replicon of pMON2341 and the hIL-3 15 gene in place of the chloramphenicol acetyl transferase gene. JM101 cells harboring this plasmid were cultured in M9 medium and treated with nalidixic acid as described above. Samples of the culture were 20 examined for protein content. It was found that this hIL-3 mutein was produced at about 6% of total cell protein as measured on Coomassie stained polyacrylamide gels.

25 EXAMPLE 3

30

35

Construction of pMON5854 (Fig. 7) which encodes [Met-(1-133)hIL-3(Arg 129)]

To increase the accumulation of hIL-3 in \underline{E} . $\underline{\operatorname{coli}}$, the coding sequence of the amino terminal portion of the protein was altered to more closely reflect the codon bias found in \underline{E} . $\underline{\operatorname{coli}}$ genes that produce high levels of proteins (Gouy and Gautier, 1982). To change the coding sequence for the amino terminal portion of the gene, a pair of synthetic oligonucleotides were inserted between the NcoI and HpaI sites within the coding sequence. About 0.5

micrograms of DNA of the plasmid pMON5847 (Example 2) was treated with NcoI and HpaI. This DNA was mixed with an annealed pair of oligonucleotides with the following sequence:

5

35

5'-CATGGCTCCAATGACTCAGACTACTTCTCTTAAGACT3'-CGAGGTTACTGAGTCTGATGAAGAGAATTCTGA-

TCTTGGGTT-3' [SEQ ID NO:6]

10 AGAACCCAA-5' [SEQ ID NO:7]

The fragments were ligated. The ligation mixture was used to transform competent JM101 to ampicillin resistance. Colonies were picked into broth. the cultures plasmid DNA was made and examined for the 15 presence of a DdeI site (CTNAG) which occurs in the synthetic sequence but not between the NcoI and HpaI sites in the sequence of pMON5847. The new recombinant plasmid was designated pMON5854. 20 nucleotide sequence of the DNA in the coding sequence of the amino terminal portion of the hIL-3 gene in pMON5854 was determined by DNA sequencing and found to be the same as that of the synthetic oligonucleotide used in ligation. Cultures of JM101 cells harboring this plasmid were grown and treated with nalidixic 25 acid to induce production of the hIL-3 mutant protein. Analysis of the proteins on Coomassie gels showed that the accumulation of hIL-3 mutein was about 25% of total cell protein in cultures harboring pMON5854, 30 significantly higher than it was in cultures harboring pMON5847.

EXAMPLE 4

Construction of pMON5887 (Fig. 12) which encodes [Met-(1-125)hIL-3]

The plasmid DNA of pMON5854 (Example 3) was

treated with EcoRI and HindIII and the larger fragment gel was purified. About 0.5 microgram of this DNA was ligated to 1 picomole of an annealed pair of oligonucleotides which encode amino acids 107 through 125 of hIL-3. The sequences of these oligonucleotides are shown below.

EcoRI to HindIII
5'-AATTCCGTCGTAAACTGACCTTCTATCTGAAAA3'-GGCAGCATTTGACTGGAAGATAGACTTTT-

10

CCTTGGAGAACGCGCAGGCTCAACAGTAATA-3' [SEQ ID NO:8]
GGAACCTCTTGCGCGTCCGAGTTGTCATTATTCGA-5' [SEQ ID NO:9]

After ligation, the DNA was used to transform competent JM101 cells to ampicillin resistance.

Colonies were picked into broth and plasmid DNA was isolated from each culture. Restriction analysis of the plasmid DNA showed the presence of an EcoRI to

HindIII fragment smaller than that of pMON5854. The nucleotide sequence of the portion of the coding sequence between the EcoRI and HindIII sites was determined to confirm the accuracy of the replaced sequence. The new plasmid was designated pMON5887 encoding Met-(1-125)hIL-3 which has the following amino acid sequence:

Met Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr Ser Trp Val Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile Leu Lys Asn Leu Leu Pro Cys Leu Pro Leu Ala Thr Ala Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys Thr Leu Glu Asn Ala Gln Gln [SEQ ID NO:10]

EXAMPLE 5

Construction of pMON5967 which encodes [Met-Ala-(15-125)hIL-3]

Plasmid DNA of pMON5887 isolated from \underline{E} . \underline{coli} GM48 (dam-) was cleaved with NcoI and ClaI and ligated to 1 picomole of an annealed pair of oligonucleotides, encoding amino acids [Met Ala (15-20)hIL-3]. The sequence of these oligonucleotides is shown below. 5'-CATGGCTAACTGCTCTAACATGAT-3'[SEQ ID NO:11]

3'-CGATTGACGAGATTGTACTAGC-5'[SEQ ID NO:12]

The resulting ligation mix was used to transform competent <u>E</u>. <u>coli</u> JM101 cells to ampicillin resistant colonies. Plasmid DNA was isolated from these cells and the size of the inserted fragment was determined to be smaller than that of pMON5887 by restriction analysis using NcoI and NsiI. The nucleotide sequence of the region between NcoI and ClaI was determined and found to be that of the synthetic oligonucleotides. The new plasmid was designated pMON5967 and cells containing it were induced for protein production. Sonicated cell pellets and supernatants were used for protein purification and bio-assay.

EXAMPLE 6

Construction of pMON5978 which encodes [Met-Ala-(15-125)hIL-3]

Plasmid DNA of pMON5967 isolated from \underline{E} . \underline{coli} GM48(dam-) was cleaved with ClaI and NsiI and ligated to 1 picomole of an annealed assembly of six oligonucleotides encoding hIL-3 amino acids 20-70 (FIG. 2). This synthetic fragment encodes three unique restriction sites, EcoRV, XhoI and PstI. The sequence of these oligonucleotides is shown in

Figure 2.

The resulting ligation mix was used to transform competent \underline{E} . \underline{coli} JM101 cells to ampicillin resistant colonies. Plasmid DNA was isolated and screened with XbaI and EcoRV for the presence of the new restriction site EcoRV. The DNA sequence of the region between ClaI and NsiI was determined and found to be the same as that of the synthetic oligonucleotides. The new plasmid was designated pMON5978, and cells containing it were induced for protein production. Sonicated cell pellets and supernatants were used for protein purification and bio-assay.

Plasmid pMON5978 encodes [Met-Ala-(15-125)hIL-3] which has the following amino acid sequence:

Met Ala Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile Leu Lys Asn Leu Leu Pro Cys Leu Pro Leu Ala Thr Ala Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys Thr Leu Glu Asn Ala Gln Gln [SEQ ID NO:13]

EXAMPLE 7

Construction of pMON13356

Plasmid pMON5988 DNA was digested with restriction enzymes NcoI and EcoRV, and the resulting 4190 base pair NcoI, EcoRV fragment contains the following genetic elements: beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and the bases encoding amino acids 47-125 of (15-125)hIL-3. The 4190 base pair NcoI, EcoRV restriction fragment

from pMON5988 was ligated to the following annealed complementary oligonucleotides from Table (2).

Oligo #13 [SEQ ID NO:27]

Oligo #14 [SEQ ID NO:28]

The ligation reaction mixture was used to transform

E. coli K-12 strain JM101 and transformant bacteria
were selected on ampicillin-containing plates.
Plasmid DNA was isolated from a colony grown in LB

broth and the size of the inserted fragment was
determined by restriction analysis employing
restriction enzymes NcoI and HindIII in double digest.
In the resulting plasmid the 99 bases between the NcoI
and EcoRV restriction sites in the (15-125) hIL-3 gene
are replaced with 22 bases from the above mentioned
oligonucleotides. This linker also contains a NdeI
recognition sequence.

20 EXAMPLE 8

Construction of pMON13344

Plasmid pMON13356 DNA was digested with restriction enzymes NcoI and EcoRV, and the resulting 4190 base pair NcoI, EcoRV fragment contains the following

- genetic elements: beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and the bases encoding amino acids 47-125 of (15-125)hIL-
- 30 3. The second DNA fragment was generated by synthetic gene assembly using the following complementary oligonucleotide pairs that have overlapping ends:

Oligo #1 [SEQ ID NO:15]

Oligo #2 [SEQ ID NO:16]

Oligo #3 [SEQ ID NO:17]

Oligo #4 [SEQ ID NO:18]

5

Oligo #9 [SEQ ID NO:23]

Oligo #10 [SEQ ID NO:24]

The assembled oligonucleotides create NcoI and EcoRV 10 restriction ends and the DNA sequence that encodes amino acids 15-46 of (15-125) hIL-3 with the following amino acid substitutions: 18I, 25H, 29R, 32A, 37P, 42A and 45V. The codons encoding amino acids 15-46 of (15-125) hIL-3 are those found in the hIL-3 cDNA 15 sequence except at those positions where amino acid substitutions were made. The 4190 base pair NcoI, EcoRV restriction fragment from pMON13356 was ligated with the pairs of annealed oligonucleotides. The ligation reaction was digested with NdeI and 20 subsequently used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated from a colony grown in LB broth. The DNA sequence was determined to be that of the 25 oligonucleotides. The plasmid, pMON13344, encodes the (15-125) hIL-3 variant with the following amino acid sequence:

EXAMPLE 20

Construction of pMON13354

The 4225 base pair EcoRI, HindIII restriction fragment 40 from pMON13359 was ligated with the following pairs of annealed complementary oligonucleotides:

Oligo #45 [SEQ ID NO:59]
Oligo #46 [SEQ ID NO:60]

Oligo #47 [SEQ ID NO:61]
Oligo #48 [SEQ ID NO:62]

The assembled oligonucleotides create EcoRI and HindIII restriction ends and the DNA sequence that encodes amino acids 106-125 of (15-125) hIL-3 with the following amino acid substitutions: 109E, 116V, 117S, 120H and The codons encoding amino acids 106-125 of (15-125) hIL-3 are those found in the hIL-3 cDNA sequence except at those positions where amino acid 10 substitutions were made. The ligation reaction was digested with NdeI and used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated 15 from a colony grown in LB broth, and the DNA was sequenced to determine that the sequence was that of the oligonucleotides. The plasmid, pMON13354, encodes the (15-125)hIL-3 variant with the following amino acid sequence:

20 **Peptide #11**

Leu Glu His Ala Gln Glu Gln Gln [SEQ ID NO:75]

DNA sequence #19 [SEQ ID NO:115] codes for the foregoing pMON13354 polypeptide.

EXAMPLE 21

Construction of pMON13360

- Plasmid pMON13352 DNA was digested with restriction enzymes NsiI and EcoRI, resulting in a 4178 base pair NsiI, EcoRI fragment. The genetic elements derived from pMON13352 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication
- as the transcription terminator, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and the bases encoding amino acids 15-71 and 106-125 of (15-125)hIL-3. Plasmid pMON13350 DNA was digested with NsiI and EcoRI. The resulting 111 base pair NsiI,
- 15 EcoRI fragment encodes amino acids 72-105 of (15-125)hIL-3. The eluted restriction fragments were concentrated and desalted using Centricon 30 concentrators. The restriction fragments were ligated, and the ligation reaction mixture was used to transform
- E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and analyzed by restriction analysis. Clones containing the correct insert lost a XmnI site as compared with pMON13352. Positive clones were
- identified by the loss of a 615 base pair XmnI fragment. The DNA was sequenced to confirm the correct insert. The resulting (15-125)hIL-3 variant has the following amino acid substitutions: 73G, 76A, 79R, 82Q, 87S, 93S, 98I, 101A, 105Q, 109E, 116V, 120Q and
- 123E. The codons encoding amino acids 72-125 of (15-125)hIL-3 are those found in the hIL-3 cDNA sequence except at those positions where amino acid substitutions were made. The plasmid, pMON13360, encodes the (15-125)hIL-3 variant with the following amino acid sequence:

Peptide #12

EXAMPLE 22

Construction of pMON13361

Plasmid pMON13352 DNA was digested with restriction enzymes NsiI and EcoRI, resulting in a 4178 base pair NsiI, EcoRI fragment. The genetic elements derived from pMON13352 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the transcription terminator, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and the bases encoding amino acids 15-71 and 106-125 of (15-125) hIL-3. Plasmid pMON13355 DNA was digested with NsiI and EcoRI. The resulting 111 base pair NsiI, EcoRI fragment encodes amino acids 72-105 of (15-125) hIL-3. The restriction fragments were ligated, and the ligation reaction mixture was used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Clones containing the correct insert contained an additional RsaI site which results in a 1200 base pairs RsaI

fragment. The DNA was sequenced to confirm the correct insert. The resulting (15-125)hIL-3 variant has the following amino acid substitutions: 73G, 76A, 79R, 82V, 87S, 93S, 98T, 101A, 105Q, 109E, 116V, 120Q and 123E.

The codons encoding amino acids 72-125 of (15-125)hIL-3 are those found in the hIL-3 cDNA sequence except at those positions where amino acid substitutions were made. The plasmid, pMON13361, encodes the (15-125)hIL-3 variant with the following amino acid sequence:

35

EXAMPLE 23

Construction of pMON13362

Plasmid pMON13354 DNA was digested with restriction
40 enzymes NsiI and EcoRI, resulting in a 4178 base pair
NsiI, EcoRI fragment. The genetic elements derived from
pMON13354 are the beta-lactamase gene (AMP), pBR327
origin of replication, phage fl origin of replication
as the transcription terminator, pAraBAD promoter, g10L
ribosome binding site, lamB secretion leader and the

bases encoding amino acids 15-71 and 106-125 of (15-125) hIL-3. Plasmid pMON13355 DNA was digested with NsiI and EcoRI. The resulting 111 base pair NsiI, EcoRI fragment encodes amino acids 72-105 of (15-125) hIL-3. The restriction fragments were ligated, and the ligation reaction mixture was used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Clones containing the correct insert contained an additional RsaI site which results in a 1200 base pairs RsaI 10 fragment. The DNA was sequenced to confirm the correct insert. The resulting (15-125) hIL-3 variant has the following amino acid substitutions: 73G, 76A, 79R, 82V, 87S, 93S, 98T, 101A, 105Q, 109E, 116V, 117S, 120H and The codons encoding amino acids 72-125 of (15-15 125) hIL-3 are those found in the hIL-3 cDNA sequence except at those positions where amino acid substitutions were made. The plasmid, pMON13362, encodes the (15-125) hIL-3 variant with the following 20 amino acid sequence:

Peptide #14

Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr His Leu

- 25 Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn Asn Leu Asn Gly

EXAMPLE 32

Construction of pMON13303

Plasmid pMON5978 DNA was digested with restriction 25 enzymes NcoI and NsiI, resulting in a 3794 base pair NcoI, NsiI fragment. The genetic elements derived from pMON5978 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the transcription terminator, precA promoter, g10L 30 ribosome binding site, and the bases encoding amino acids 72-125 of (15-125) hIL-3. Plasmid pMON13365 DNA was digested with NcoI and NsiI. The resulting 170 base pair NcoI, NsiI fragment encodes amino acids 15-71 of (15-125) hIL-3. The restriction fragments were 35 ligated, and the ligation reaction mixture was used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis, and sequenced to confirm the correct insert. 40 The resulting (15-125)hIL-3 variant has the following amino acid substitutions: 18I, 25H, 29V, 32A, 37S, 42S, 45M, 51R, 55L, 59L, 62V, 67N and 69E. The codons

encoding amino acids 15-71 of (15-125)hIL-3 are those found in the hIL-3 cDNA sequence except at those positions where amino acid substitutions were made. The plasmid, pMON13303, encodes the (15-125)hIL-3

5 variant with the following amino acid sequence: Peptide #23

Met Ala Asn Cys Ser Ile Met Ile Asp Glu Ile Ile His His Leu

35 EXAMPLE 42

Construction of pMON5987

40

Plasmid pMON6458 DNA was digested with restriction enzymes NcoI and HindIII, resulting in a 3940 base pair NcoI, HindIII fragment. The genetic elements derived from pMON6458 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the transcription terminator, pAraBAD promoter, g10L ribosome binding site and lamB secretion leader.

Plasmid pMON5978 DNA was digested with NcoI and NsiI. The resulting 170 base pair NcoI, NsiI fragment encodes

amino acids 15-71 of (15-125)hIL-3. Plasmid pMON5976

DNA was digested with NsiI and HindIII. The resulting
175 base pair NsiI, HindIII fragment encodes amino acids
72-125 of (15-125)hIL-3. The restriction fragments

were ligated, and the ligation reaction mixture was
used to transform <u>E. coli</u> K-12 strain JM101.

Transformant bacteria were selected on ampicillincontaining plates. Plasmid DNA was isolated and
screened for the restriction sites EcoRV and NheI and
DNA sequenced to confirm the correct insert.

EXAMPLE 43

Construction of pMON5988

The plasmid DNA of pMON5987 was digested with NheI and EcoRI, resulting in a 3903 base pair NheI, EcoRI fragment. The 3903 base pair NheI, EcoRI fragment was ligated to 1.0 picomoles of the following annealed oligonucleotides:

20

5'-CTAGCCACGCCACCCACGCGACATCCAATCCATATCAA-3'-GGTGCCGGCGTGGGTGCGCTGTAGGTTAGGTATAGTT-

GGACGGTGACTGGAATG-3' [SEQ ID NO:131]

25 CCTGCCACTGACCTTACAATT-5' [SEQ ID NO:132]

The ligation reaction mixture was used to transform \underline{E} . $\underline{\operatorname{coli}}$ K-12 strain JM101 and transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm positive clones. This plasmid was constructed to change alanine 101 to aspartic acid in the hIL-3 gene

(15-125). This plasmid was designated pMON5988.

35

30

EXAMPLE 44

Construction of pMON5853 (Fig 6) which encodes [Met-(15-133) hIL-3 (Arg 129)]

Plasmid DNA of pMON5847 (Example 2) was treated with NcoI. The restriction enzyme was inactivated by heat treatment (65°C for 10 minutes). The DNA was then treated with large fragment of DNA polymerase I (Klenow) in the presence of all four nucleotide precursors. This produces DNA termini with nonoverlapping ends. After 5 minutes at 37°C, the 10 polymerase was inactivated by heat treatment at 65°C for 10 minutes. The DNA was then treated with HpaI, an enzyme which produces non-overlapping termini. was ethanol precipitated and ligated. The ligation reaction mixture was used to transform competent JM101 cells to ampicillin resistance. Colonies were picked 15 and plasmid DNA was analyzed by restriction analysis. A plasmid designated pMON5853 was identified as one containing a deletion of the amino terminal 14 codons of the hIL-3 gene. The DNA sequence for the junction of the ribosome binding site to the (15-133) hIL-3 gene 20 was determined to be the following:

5'-AAGGAGATATATCCATGAACTGCTCTAAC-3' [SEQ ID NO:133] M N C S N [SEQ ID NO:134]

25

30

The lower line contains the one letter code for the amino acids specified by the coding sequence of the amino terminus of the 15-133 hIL-3 gene. These are methionine, asparagine, cysteine, serine and asparagine.

When cultures of JM101 cells harboring this plasmid were induced with nalidixic acid, it was found that hIL-3 (15-133) accumulated at levels higher than hIL-3 (pMON5847).

35 The plasmid, pMON5853, encodes Met-(15-133) hIL-3 (Arg¹²⁹) which has the following amino acid sequence:

Met Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala

5 Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile

10 Leu Ala Ile Phe [SEQ ID NO:135]

EXAMPLE 45

Construction of pMON5873 which encodes [Met-(1-133)hIL-

15 3]

20

25

30

35

The gene obtained from British Biotechnology, Ltd. specified arginine at codon position 129. The amino acid specified in the native hIL-3 cDNA is serine. To produce a protein with the native sequence at this position, the portion of the coding sequence between the EcoRI site at codons 106 and 107 and the NheI site at codons 129 and 130 was replaced. Plasmid DNA of pMON5854 (Example 3) and pMON5853 (Example 44) were treated with EcoRI and NheI. The larger fragments of each were gel purified. These were ligated to a pair of an annealed oligonucleotides with the following sequences:

5'-AATTCCGTCGTAAACTGACCTTCTATCTGAAAACC-

3'-GGCAGCATTTGACTGGAAGATAGACTTTTGG-

TTGGAGAACGCGCAGGCTCAACAGACCACTCTGTCG-3' [SEQ ID NO: 136]

AACCTCTTGCGCGTCCGAGTTGTCTGGTGAGACAGCGATC-5' [SEQ ID NO:137]

The ligation reaction mixtures were used to transform competent JM101 cells to ampicillin resistance. Colonies were picked into broth and grown. Plasmid DNA was isolated and screened for the presence of a new StyI recognition site present in the synthetic DNA and not in pMON5854 and pMON5853. The nucleotide sequence of the gene in the region between EcoRI and NheI was determined and found to be that of the synthetic oligonucleotides. The new plasmids were designated pMON5873 encoding [Met-(1-133)hIL-3] and pMON5872 encoding [Met-(15-133)hIL-3].

The plasmid, pMON5873, encodes Met-(1-133)hIL-3
which has the following amino acid sequence:
Met Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr Ser

Trp Val Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn

EXAMPLE 46

Construction of pMON6458

Plasmid pMON6525 was digested with restriction enzymes
30 HindIII and SalI and the resulting 3172 base pair
fragment was isolated from a 1% agarose gel by
interception onto DEAE membrane. The genetic elements
derived from pMON6525 are the beta-lactamase gene
(AMP), pBR327 origin of replication, and phage f1
35 origin of replication as the transcription terminator.
(The genetic elements derived from plasmid pMON6525 are

identical to those in plasmid pMON2341 which could also be used to construct pMON6458.) Plasmid pMON6457 was digested with restriction enzymes HindIII and SalI and the resulting 1117 base pair fragment was isolated by PAGE and crush and soak elution. The genetic elements derived from pMON6457 are the pAraBAD promoter, q10L ribosome binding site, lamB secretion leader and the (15-125) hIL-3 gene. The restriction fragments were ligated and the ligation reaction mixture was used to 10 transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Clones containing the hIL-3 gene 15 (encoding amino acids 15-125) contained a 345 base pair NcoI, HindIII restriction fragment. This construct was designated pMON6458. This plasmid was constructed to eliminate an EcoRI restriction site outside the hIL-3 gene coding region in plasmid pMON6457. 20

EXAMPLE 47

Construction of pMON5976 which encodes [Met-(15-125)hIL-3(Ala101)]

25

30

35

The plasmid DNA of pMON5941 isolated from the dam- \underline{E} . \underline{coli} strain GM48 was cleaved with ClaI and NsiI and ligated to 1 picomole of an annealed assembly of six oligonucleotides encoding amino acids 20-70 of hIL-3 (FIG. 2). This synthetic fragment encodes three unique restriction sites, EcoRV, XhoI and PstI. The sequence of these oligonucleotides is shown in Figure 2.

The resulting ligation mix was used to transform competent \underline{E} . $\underline{\operatorname{coli}}$ JM101 cells to ampicillin resistant colonies. Plasmid DNA was isolated and the inserted fragment was determined to have both an EcoRV and NheI

site. The nucleotide sequence of the region between ClaI and NsiI was determined and found to be that of the synthetic oligonucleotides. At codons 86-87 of a nucleotide sequence coding for (15-125)hIL-3, an NheI site was introduced. The plasmid with this alteration was designated pMON5941. This plasmid encodes Met-(15-125)hIL-3 which is altered at position 101 by replacement of aspartate by alanine.

10 Plasmid pMON5976 encodes Met-(15-125)hIL-3(Ala¹⁰¹) which has the following amino acid sequence:

Met Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
15 Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala

35

10

EXAMPLE 50

Construction of pMON6455

Plasmid pMON5905 was digested with restriction enzymes HindIII and NcoI resulting in a 3936 base pair fragment. The genetic elements derived from pMON5905 are the beta-lactamase gene (AMP), pBR327 origin of replication, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and phage f1 origin of replication as the transcription terminator. The following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, g10L ribosome binding site and phage fl origin of replication as the transcription terminator, derived from plasmid pMON5905 are identical to these in plasmid pMON5594 which could also be used to construct pMON6455. The AraBAD promoter is identical to that described in pMON6235. The lamB signal peptide sequence used in pMON6455 is that shown in Figure 8 fused to hIL-3 (15-125) at the NcoI site. Plasmid pMON5887 was digested with restriction enzymes HindIII and NcoI, resulting in a

384 base pair NcoI, HindIII fragment. The restriction fragments were ligated, and the ligation reaction mixture was used to transform into <u>E</u>. <u>coli</u> K-12 strain JM101. Transformant bacteria were selected on

5 ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Positive clones containing the hIL-3 gene (encoding amino acids 1-125) contained a 384 base pair NcoI, HindIII restriction fragment. This construct was designated pMON6455.

EXAMPLE 51

Construction of pMON6456

15 Plasmid pMON5905 was digested with restriction enzymes HindIII and NcoI resulting in a 3936 base pair fragment. The genetic elements derived from pMON5905 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the 20 transcription terminator, pAraBAD promoter, g10L ribosome binding site and the lamB secretion leader. Plasmid pMON5871 was digested with restriction enzymes HindIII and NcoI, resulting in a 330 base pair NcoI, HindIII fragment. The genetic element derived from pMON5871 encompassed the bases encoding the (1-107) 25 The restriction fragments were ligated, hIL-3 gene. and the ligation reaction mixture was used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was 30 determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Clones containing the hIL-3 gene (encoding amino acids 1-107) contained a 330 base pair NcoI, HindIII 35 restriction fragment. This construct was designated pMON6456.

EXAMPLE 52

Construction of pMON6457

Plasmid pMON6455 DNA grown in <u>E. coli</u> strain GM48 (dam-)was digested with restriction enzymes NcoI and ClaI, resulting in a 4263 base pair NcoI, ClaI fragment. The restriction fragment was ligated to 1.0 picomoles of annealed oligonucleotides with the following sequence coding for Met Ala 14-20 hIL-3:

5'-CATGGCTAACTGCTCTAACATGAT-3'[SEQ ID NO:151]
3'-CGATTGACGAGATTGTACTAGC-5'[SEQ ID NO:152]

15

20

25

35

10

The resulting DNA was transformed into <u>E</u>. <u>coli</u> K-12 strain JM101 and transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes XbaI and EcoRI in double digest. Positive clones containing the hIL-3 gene (encoding aa 15-125 of hIL-3) contained a 433 base pair XbaI, EcoRI restriction fragment. This construct was designated pMON6457. This plasmid was constructed to delete the first 14 amino acids of hIL-3. The coding sequence of the resulting gene begins as follows:

5' ATG GCT AAC TGC... 3' [SEQ ID NO:153]

Met Ala Asn Cys... [SEQ ID NO:154]

15

The first two amino acids (Methionine, Alanine) create an NcoI restriction site and a signal peptidase cleavage site between the lamB signal peptide and (15-125) hIL-3. Plasmid pMON6457 encodes (15-125) hIL-3

which has the amino acid sequence designated SEQ ID NO:65.

EXAMPLE 53

Construction of pMON6235

One of the DNA fragments used to create this plasmid was generated by site-directed mutagenesis employing PCR techniques described previously using the following oligonucleotides, Oligo #51 [SEQ ID NO:155] and Oligo #52 [SEQ ID NO:156], were used as primers in this procedure. The template for the PCR reaction was $\underline{\text{E.}}$ $\underline{\text{coli}}$ strain W3110 chromosomal DNA, prepared as described in Maniatis (1982). The oligonucleotide primers were designed to amplify the AraBAD promoter (Greenfield et al., 1978). The resulting DNA product was digested with the restriction enzymes SacII and

- was digested with the restriction enzymes SacII and BglII. The reaction mixture was purified as described previously. Plasmid, pMON5594, DNA was digested with SacII and BglII, resulting in a 4416 base pair
- SacII, BglII restriction fragment which contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, G10L ribosome binding site, phage f1 origin of replication as the
- transcription terminator and the chloramphenicol acetyl transferase (cat) gene. The 4416 base pair SacII,BglII restriction fragment from pMON5594 was ligated to the PCR-generated SacII, BglII DNA fragment. The ligation mixture was used to transform E. coli K-112 strain
- JM101. Positive clones contained a 323 base pair SacII, BglII fragment and were DNA sequenced to confirm that the SacII, BglII fragment was the AraBAD promoter. This construct was designated pMON6235.

5

10

15

Construction of pMON5647

Plasmid pMON5585 [prepared as disclosed in EP 0241446 incorporated herein by reference in its entirety] DNA was digested with restriction enzymes NcoI and HindIII resulting in a 3273 base pair NcoI, HindIII fragment. The genetic elements derived from pMON5585 are the pBR327 origin of replication, precA promoter, g10L ribosome binding protein, bovine somatotropin gene (bST), beta-lactamase gene (AMP) and T7 transcription terminator. Plasmid pMON3267 [prepared as disclosed 10 in EP 0241446 incorporated herein by reference in its entirety] DNA was digested with NcoI and HindIII enzymes resulting in a 580 base pair NcoI, HindIII fragment which contains the porcine somatotropin (pST) gene. The restriction fragments were ligated and the 15 ligation reaction mixture was used to transform E. coli strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis and 20 sequenced to confirm the correct insert.

EXAMPLE 55

Construction of pMON710

Plasmid pMON709 consists of a 1614 base pair AvaI, EcoRI fragment of transposon TN7, containing the streptomycin adenylyltransferase gene (Fling et al., 1985) and a pUC9 linker (XmaI, HindIII) cloned between the HindIII and EcoRI sites of pUC19. The streptomycin adenylyltransferase gene COnfers resistance to streptomycin and spectinomycin. Plasmid pMON709 was mutagenized by oligonucleotide site-directed mutagenesis (methods described in Zoller and Smith, 1982) to introduce an EcoRV site at the 3' end of the streptomycin adenylyltransferase gene. The oligonucleotide, Oligo # 53 [SEQ ID NO:157], was used

in this procedure to introduce the EcoRV site. The resulting plasmid was designated pMON710.

5 EXAMPLE 56

Construction of pMON5723

10

15

20

Plasmid pMON5647 DNA was digested with restriction enzymes DraI and SspI resulting in a 2916 base pair DraI, SspI fragment. The genetic elements derived from pMON5647 are the pBR327 origin of replication, precA promoter, g10L ribosome binding protein, porcine somatotropin gene (pST) and T7 transcription terminator (Dunn and Strudier, 1983). Plasmid pMON710 DNA was digested with restriction enzymes HincII and EcoRV resulting in 940 base pair HincII, EcoRV fragment containing the streptomycin adenylyltransferase gene which infers resistance to streptomycin and spectinomycin. The restriction fragments were ligated and the ligation reaction mixture was used to transform E. coli strain JM101. The DraI, SspI, HincII and EcoRV restriction sites are lost as a result of the cloning. Transformant bacteria were selected on spectinomycin-

restriction sites are lost as a result of the cloning. Transformant bacteria were selected on spectinomycin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis and sequenced to confirm the correct insert.

EXAMPLE 57

Construction of pMON13361

Plasmid pMON13288 was mutagenized by oligonucleotide site-directed mutagenesis (method described in Kunkel, 1985) to eliminate a NsiI site in the (15-125) hIL-3 variant coding region. Codon 70 of (15-125) hIL-3, encoding asparagine, was converted from AAT to AAC destroying the NsiI recognition site. The oligonucleotide, Oligo # 54 [SEQ ID NO:158], was used

in this procedure to eliminate the NsiI site. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis to confirm the loss of the NsiI site and sequenced to confirm the sequence of the (15-125) hIL-3 variant gene. The plasmid, pMON13361, encodes the (15-125) hIL-3 variant with the amino acid sequence of PEPTIDE #25 [SEQ ID NO:89].

DNA sequence # 32 [SEQ ID NO:160] codes for the foregoing pMON13361 polypeptide.

EXAMPLE 58

Construction of pMON14058

- Plasmid pMON13361 was mutagenized by oligonucleotide site-directed mutagenesis (method described by Taylor et al., 1985 using a kit from Amersham, Arlington Heights, Ill.) to eliminate a EcoRV site in the (15-125) hIL-3 variant coding region. Codon 46 and 47 of
- 20 (15-125) hIL-3, encoding asparagine and isoleucine, were converted from GAT to GAC and ATC to ATT respectively, destroying the EcoRV recognition site. The oligonucleotide, Oligo # 55 [SEQ ID NO:159], was used in this procedure to eliminate the EcoRV site.
- Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis to confirm the loss of the EcoRV site and sequenced to confirm the sequence of the (15-125) hIL-3 variant gene. The plasmid, pMON14058,
- 30 encodes the (15-125) hIL-3 variant with the amino acid sequence of **PEPTIDE #25** [SEQ ID NO:89].
 - DNA sequence # 33 [SEQ ID NO:161] codes for the foregoing pMON14058 polypeptide.

10

Construction of pMON13438

Plasmid pMON5723 DNA was digested with restriction enzymes NcoI and HindIII resulting in a 3278 NcoI, HindIII fragment. The genetic elements derived from pMON5723 are the pBR327 origin of replication, precA promoter, g10L ribosome binding protein, T7 transcription terminator and streptomycin adenylyltransferase gene. 'Plasmid pMON14058 DNA was digested with NcoI and HindIII resulting in a 345 base 10 pair NcoI, HindIII fragment which contains the (15-125) hIL-3 gene with the following amino acid substitutions: 18I, 25H, 29R, 32N, 37P, 42S, 45M, 51R, 55T, 59L, 62V, 67H, 69E,73G, 76A, 79R, 83Q, 87S, 93S, 98I, 101A, 105Q, 109E, 116V, 120Q and 123E. The restriction fragments 15 were ligated and the ligation reaction mixture was used to transform E. coli strain JM101. Transformant bacteria were selected on spectinomycin-containing plates. Plasmid DNA was isolated, analyzed by restriction analysis and sequenced to confirm the 20 correct insert. The plasmid, pMON13438, encodes the (15-125) hIL-3 variant with the amino acid sequence of PEPTIDE #25 [SEQ ID NO:89]. DNA sequence # 33 [SEQ ID NO:161] codes for the foregoing pMON13438 polypeptide.

Construction of pMON13326

5

The 3683 base pair NcoI, EcoRI DNA fragment from plasmid pMON13215 is ligated to the 281 base pair NcoI, EcoRI DNA fragment from plasmid pMON13285. The following genetic elements are derived from pMON13215;

- beta-lactamase gene (AMP), pBR327 origin of replication, phage F1 origin of replication as the transcription terminator, precA promoter, g10L ribosome binding site and the bases encoding amino acids 106-125 of the (15-125) hIL-3 gene with the following change,
- 15 116W. The bases encoding amino acids 15-105 of the (15-125) gene with the following change, 42D, 45M, 46S and 50D derived from pMON13285. The resulting plasmid, pMON13326, encodes the (15-125) hIL-3 variant with the following amino acid sequence:

20

30

35

Peptide # A6 [SEQ ID NO:262]

EXAMPLE 64

25 Construction of pMON13332

Plasmid pMON13326 DNA is digested with restriction enzymes NsiI and EcoRI and the resulting 3853 base pair NsiI, EcoRI fragment contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, recA promoter, g10L ribosome binding site and the bases encoding amino acids 15-71 and 106-125 of (15-125) hIL-3 gene with the following changes 42D, 45M, 46S, 50D and 116W. The 3853 base pair NsiI, EcoRI restriction fragment from pMON13326 is

ligated to the following annealed complementary oligonucleotides.

Oligo #15(A) [SEQ ID NO:168]

5

Oligo #16(A) [SEQ ID NO:169]

In the resulting plasmid the 111 bases between the NsiI and EcoRI restriction sites in the (15-125) hIL-3 gene are replaced with 24 bases from the above mentioned oligonucleotides. This linker also creates a NdeI recognition sequence.

EXAMPLE 65

15

Construction of pMON13330

The 3846 base pair PstI, EcoRI DNA fragment from plasmid pMON13332 is ligated to the 118 base pair PstI, EcoRI DNA fragment from plasmid pMON13305. 20 following genetic elements are derived from pMON13332; beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the transcription terminator, recA promoter, g10L ribosome binding site and the bases encoding amino acids 15-69 25 and 106-125 of the (15-125) hIL-3 gene with the following change, 42D, 45M, 46S, 50D and 116W. The bases encoding amino acids 70-105 of the (15-125) gene with the following change, 95R, 98I and 100R are 30 derived from pMON13305. The resulting plasmid, pMON13330, encodes the (15-125) hIL-3 variant with the following amino acid sequence:

Peptide # A7 [SEQ ID NO:263]

35

EXAMPLE 66

Construction of pMON13329

The 3846 base pair PstI, EcoRI DNA fragment from plasmid pMON13332 is ligated to the 118 base pair PstI, EcoRI DNA fragment from plasmid pMON13304. following genetic elements are derived from pMON13332; beta-lactamase gene (AMP), pBR327 origin of replication, phage fl origin of replication as the 10 transcription terminator, recA promoter, g10L ribosome binding site and the bases encoding amino acids 15-69 and 106-125 of the (15-125) hIL-3 gene with the following change, 42D, 45M, 46S, and 116W. The bases encoding amino acids 70-105 of the (15-125) gene with the following change, 98I and 100R are derived from 15 pMON13304. The resulting plasmid, pMON13329, encodes the (15-125) hIL-3 variant with the following amino acid sequence:

20 Peptide # A8 [SEQ ID NO:406]

EXAMPLE 67

Construction of pMON5853 (Fig 6) which encodes [Met-25 (15-133)hIL-3(Arg129)]

Plasmid DNA of pMON5847 (Example 2) was treated with NcoI. The restriction enzyme was inactivated by heat treatment (65°C for 10 minutes). The DNA was then treated with large fragment of DNA polymerase I (Klenow) in the presence of all four nucleotide precursors. This produces DNA termini with non-overlapping ends. After 5 minutes at 37°C, the polymerase was inactivated by heat treatment at 65°C for 10 minutes. The DNA was then treated with HpaI, an enzyme which produces non-overlapping termini. The DNA

was ethanol precipitated and ligated. The ligation reaction mixture was used to transform competent JM101 cells to ampicillin resistance. Colonies were picked and plasmid DNA was analyzed by restriction analysis.

A plasmid designated pMON5853 was identified as one containing a deletion of the amino terminal 14 codons of the hIL-3 gene. The DNA sequence for the junction of the ribosome binding site to the (15-133) hIL-3 gene was determined to be the following:

10

5'-AAGGAGATATATCCATGAACTGCTCTAAC-3' [SEQ ID NO:400]

M N C S N [SEQ ID NO:401]

The lower line contains the one-letter code for the amino acids specified by the coding sequence of the amino terminus of the 15-133 hIL-3 gene. These are methionine, asparagine, cysteine, serine and asparagine.

When cultures of JM101 cells harboring this plasmid were induced with nalidixic acid, it was found that hIL-3 (15-133) accumulated at levels higher than hIL-3 (pMON5847).

The plasmid, pMON5853, encodes Met-(15-133) hIL-3 (Arg^{129}) which has the following amino acid sequence:

Met Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
30 Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn

Leu Ala Ile Phe [SEQ ID NO:402]

EXAMPLE 68

5 Construction of pMON13252

Plasmid, pMON2341, DNA was digested with restriction enzymes NcoI and HindIII resulting in a 3619 base pair NcoI/HindIII fragment. The genetic elements derived from pMON2341 are the beta-lactamase gene (AMP), pBR327 10 origin of replication F1 phage origin of replication as the transcription terminator, precA, g10L ribosome binding site. The plasmid encoding the hIL-3 (15-125) Asp⁽⁵⁰⁾ variant, was digested with NcoI and HindIII resulting in a 345 base pair NcoI/HindIII fragment. 15 This 345 Base pair NcoI/HindIII fragment was ligated with the 3619 base pair fragment from pMON2341 and the ligation reaction mixture was used to transform E.coli K-12 strain JM101. Plasmid DNA was isolated and screened by restriction analysis using NcoI and 20 HindIII. Positive clones contained a 345 base pair NcoI/HindIII fragment. This construct was designated pMON13252. The plasmid, pMON13252, encodes the (15-125) hIL-3 variant with the following amino acid 25 sequence:

PEPTIDE A10; (15-125) HIL-3 Asp (50) pMON13252

Examples 69-76

The variants in Table 5 were constructed by cassette mutagenesis using methods described in the Materials 25 and Methods and the Examples contained herein, particularly Examples 54-58 . Parental plasmid DNA (Table 5), digested with the appropriate restriction enzymes (Table 5), was ligated with the indicated annealed pairs of complementary oligonucleotides (Table 30 5). The assembled oligonucleotides create appropriate restriction ends and a portion of the (15-125) hIL-3 gene sequence (pMON13288 [SEQ ID NO:100]). Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the 35 (15-125) hIL-3 variant gene were made. The

oligonucleotides create change(s) in the (15-125) hIL-3 gene which encode the corresponding amino acid substitution(s) in the variant polypeptide (Table 5). The amino acids substitutions in addition to and/or different from those in polypeptide # 25 [SEQ ID NO:89] are indicated in Table 5. The table also shows the plasmid designation (pMON number), DNA sequence identification number for the mutated hIL-3 gene and the identification number for the the resulting variant polypeptide. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 5 is shown in Table 1.

Examples 77-82

15

The variants in Table 6 were constructed by methods described in the Materials and Methods and the Examples contained herein, particularly in Examples 60 and 61. Parental plasmid DNA (Table 6), digested with the 20 appropriate restriction enzymes (Table 6), was ligated with the indicated restriction fragment (Table 6). Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. 25 The resulting mutated (15-125) hIL-3 genes encode the corresponding amino acid substitutions in the variant polypeptides (Table 6). The amino acids substitutions in addition to and/or different from those in polypeptide # 25 [SEQ ID NO:89] are indicated in Table 30 6. The table also shows the plasmid designation (pMON number), DNA sequence identification number for the mutated hIL-3 gene and the identification number for the the resulting variant polypeptide. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 6 is shown in Table 35 1.

Example 83

Construction of pMON13368

5

One of the DNA fragments to construct the plasmid, pMON13368, was generated by site-directed mutagenesis employing PCR techniques described in the Materials and Methods and the Examples contained herein, 10 particularly Example 53. The template for the PCR reaction was plasmid, pMON13289, DNA using the oligonucleotides, Oligo #B13 18I23A25H [SEQ ID NO: 182] and Oligo #B14 2341HIN3 [SEQ ID NO:183], as primers. The resulting DNA product was digested with the restriction enzymes NcoI and HindIII. Upon 15 completion, the digest was heated at $70\Box C$ for 15 minutes to inactivate the enzymes. The restriction fragment was purified by phenol/chloroform extraction and precipitation with equal volume isopropanol in the 20 presence of 2M NH4OAc. The oligonucleotide, Oligo #B13 18I23A25H [SEQ ID NO:182], changes the codon at position 23 of (15-125) hIL-3 variant gene pMON13289 [SEQ ID NO:103] from 'ATT' to 'GCA' (Ile to Ala). The 3619 base pair NcoI, HindIII restriction fragment from 25 pMON2341 was ligated to the PCR-generated NcoI, HindIII restriction fragment. Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. The plasmid, pMON13368, contains the 30 (15-125) hIL-3 variant gene (DNA sequence #B15 [SEQ ID NO:346]) which encodes the (15-125) hIL-3 variant polypeptide with the following amino acid sequence:

Polypeptide #B15 [SEQ ID NO.:278]

35

272

Construction of pMON13380

Plasmid, pMON13368, DNA was digested with restriction enzymes EcoRI and HindIII. The resulting 3900 base pair EcoRI, HindIII fragment contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage F1 origin of replication as the transcription terminator, precA promoter, g10L ribosome 10 binding site and the DNA sequence encoding amino acids 15-105 of the variant pMON13368. The 3900 base pair EcoRI, HindIII restriction fragment from pMON13368 was ligated to the following annealed complementary oligonucleotides.

15

30

35

	Oligo	# B48	9E12Q6V1	[SEQ	ID	NO:217]
	Oligo	# B49	9E12Q6V3	[SEQ	ID	NO:218]
			•			
	Oligo	#49	120Q123E2	[SEQ	ID	NO:63]
20	Oligo	#50	120Q123E4	[SEQ	ΙD	NO:64]

When assembled, the oligonucleotides create EcoRI and HindIII restriction ends and the DNA sequence that encodes amino acids 106-125 of (15-125) hIL-3 with the 25 following amino acid substitution; 109E, 112Q, 116V, 120Q and 123E. The codons used in the (15-125) hIL-3 gene are those found in the hIL-3 cDNA sequence except at those positions where amino acid substitutions were made. Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. The plasmid, pMON13380, contains the (15-125) hIL-3 variant gene (DNA sequence #B16 [SEQ ID NO:347]) which encodes the (15-125) hIL-3 variant polypeptide with the following amino acid sequence:

Polypeptide #B16 [SEQ ID NO.:279]

Example 85

5 Construction of pMON13476

One of the DNA fragments to construct the plasmid, pMON13476, was generated by site-directed mutagenesis employing PCR techniques described in the Materials and Methods and the Examples contained herein, 10 particularly Example 54. The template for the PCR reaction was plasmid, pMON13287, DNA using the oligonucleotides, Oligo #B13 18I23A25H [SEQ ID NO:182] and Oligo #B14 2341HIN3 [SEQ ID NO.:183] as primers. 15 The resulting DNA product was digested with the restriction enzymes NcoI and HindIII. Upon completion, the digest was heated at 70 \(\text{TC} \) for 15 minutes to inactivate the enzymes. The restriction fragment was purified by phenol/chloroform extraction and precipitation with equal volume isopropanol in the 20 presence of 2M NH4OAc. The oligonucleotide, Oligo #B13 18I23A25H [SEQ ID NO.:182], changes the codon at position 23 of (15-125) hIL-3 variant gene, pMON13287, [SEQ ID NO:97] from 'ATT' to 'GCA' (Ile to Ala). The 3619 base pair NcoI, HindIII restriction fragment from 25 pMON2341 was ligated to the PCR-generated NcoI, HindIII restriction fragment. Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. The resulting clone also contained a 30 change, that was not designed in the mutagenic oligonucleotide, which changed the codon at position -1 from 'GCT' to 'GAT' which changes the amino acid from Alanine to Aspartic Acid. The plasmid, pMON13476, 35 contains the (15-125) hIL-3 variant gene (DNA sequence

#B52 [SEQ ID NO:303]) which encodes the (15-125) hIL-3

variant polypeptide with the following amino acid sequence:

Polypeptide #B52 [SEQ ID NO.:314]

5

Examples 86-92

The variants in Table 7 were constructed by PCR 10 techniques using methods described in the Materials and Methods and the Example contained herein, particularly Example 51. Two sequential PCR reactions were used to create the variants. In the first PCR reaction pMON13287 plasmid DNA served as the template and the 15 two oligonucleotides indicated in Table 7 served as the primers. Following the PCR extension reaction, the PCR product was partially purified to remove primer that was not extended. In the second PCR reaction pMON13287 plasmid DNA served as the template, the purified PCR product from the first PCR reaction served as one of 20 the primers and the Oligo #B14 2341Hin3 [SEO ID NO:183] as the second primer. The product from the second PCR reaction was partially purified and digested with restriction enzymes NcoI and HindIII and ligated with the 3619 base pair NcoI, HindIII fragment from pMON2341. 25 Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. The amino acids substitutions in addition to and/or different from those in polypeptide # 24 [SEQ ID NO:88] 30 are indicated in Table 7. The table also shows the plasmid designation (pMON number), DNA sequence identification number for the mutated hIL-3 gene and the identification number for the the resulting variant 35 polypeptide. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 7 is shown in Table 1.

Examples 93-120

The variants in Table 8 were constructed by cassette mutagenesis using methods described in the Materials and Methods and the Examples contained here, particularly Examples 54-58. Parental plasmid DNA (Table 8), digested with the appropriate restriction enzymes (Table 8), was ligated with the indicated annealed pairs of complementary oligonucleotides (Table 10 8). The assembled oligonucleotides create the appropriate restriction ends and a portion of (15-125) hIL-3 gene (pMON13288 [SEQ ID NO:100]) sequence. The oligonucleotides create change(s) in the (15-125) hIL-3 15 variant gene which encode the corresponding amino acid substitution(s); and/or deletions from the C-terminus of the variant polypeptide (Table 8). Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the 20 (15-125) hIL-3 variant gene were made. The amino acids substitutions in addition to and/or different from those in polypeptide # 25 [SEQ ID NO:88] are indicated in Table 8. The table also shows the plasmid designation (pMON number), DNA sequence identification number for the mutated hIL-3 gene and the 25 identification number for the the resulting variant polypeptide. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 5 is shown in Table 1. 30

Example 121

Construction of pMON13446

Plasmid, pMON13287, DNA (purified from the E. coli 35 strain GM48 {dam-}) was digested with restriction enzymes NcoI and ClaI. The resulting 3942 base pair NcoI, ClaI fragment contains the following genetic

elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage F1 origin of replication as the transcription terminator, precA promoter, g10L ribosome binding site and the DNA sequence encoding amino acids 21-125 of the (15-125) hIL-3 variant pMON13287. The 3942 base pair NcoI, ClaI restriction fragment from pMON13368 was ligated to the following annealed complementary oligonucleotides.

10 Oligo #B57 338UP [SEQ ID NO:226]

Oligo #B56 338DOWN [SEQ ID NO:225]

When assembled, the oligonucleotides create NcoI and ClaI restriction ends and the DNA sequence that encodes the following 14 amino acid sequence; Met Ala Tyr Pro Glu Thr Asp Tyr Lys Asp Asp Asp Asp Lys [SEQ ID NO:403] and the DNA sequence which encodes amino acids 15-20 of the (15-125) hIL-3 variant gene, pMON13287 [SEQ ID

20 NO:97]. The resulting variant polypeptide has a 14 amino acid N-terminal extension fused to the (15-125) hIL-3 variant polypeptide, pMON13288 [SEQ ID NO: 88]. The plasmid, pMON13446, contains the (15-125) hIL-3 variant gene (DNA sequence #B53 [SEQ ID NO:404]) which

25 encodes the (15-125) hIL-3 variant polypeptide with the following amino acid sequence:

Polypeptide #B53 [SEQ ID NO.:315]

30 Example B54

Construction of pMON13390

35

Plasmid, pMON13288, DNA (purified from the E. coli strain GM48 {dam-}) was digested with restriction enzymes NcoI and ClaI. The resulting 3942 base pair NcoI, ClaI fragment contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage F1 origin of replication as the

transcription terminator, precA promoter, g10L ribosome binding site and the DNA sequence encoding amino acids 21-125 of the (15-125) hIL-3 variant pMON13288. The 3942 base pair NcoI, ClaI restriction fragment from pMON13288 was ligated to the following annealed complementary oligonucleotides.

Oligo #B57 338UP [SEQ ID NO:226]

10 Oligo #B56 338DOWN [SEQ ID NO:225]

When assembled, the oligonucleotides create NcoI and ClaI restriction ends and the DNA sequence which encodes the following 14 amino acid sequence; Met Ala

- Tyr Pro Glu Thr Asp Tyr Lys Asp Asp Asp Lys [SEQ ID NO:403] and the DNA sequence which encodes amino acids 15-20 of the (15-125) hIL-3 variant gene pMON13288 [SEQ ID NO:100]. The resulting variant has a 14 amino acid N-terminal extension fused to the (15-125) hIL-3
- variant polypeptide, pMON13288 [SEQ ID NO:88]. The plasmid, pMON13390, containes the (15-125) hIL-3 variant gene (DNA sequence #B54 [SEQ ID NO.:405] which encodes the (15-125) hIL-3 variant polypeptide with the following amino acid sequence:
- 25 Polypeptide #B54 [SEQ ID NO:316]

Examples 133-136

The variants in Table 10 were constructed by methods

described in Materials and Methods and in Examples
contained herein, particularly Examples 54-58. Parental
plasmid DNA (Table 10), digested with the appropriate
restriction enzymes (Table 10) was ligated with the
indicated restriction fragment containing the changes

listed (Table 10). The resulting mutated (15-125) IL-3
genes encode the corresponding amino acid substitutions
in the variant polypeptides (Table 10). The amino acid

substitutions in addition to and/or different from those in polypeptide #25 [SEQ ID NO: 89] are indicated in Table 10. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 10 is shown in Table 1.

Examples 123-132

The variants in Table 9 were constructed by cassett 10 mutagenesis using methods described in Materials and Methods and in Examples 54-58 contained herein. Parental plasmid DNA (Table 9), digested with the appropriate restriction enzymes (Table 9), was ligated with the indicated annealed pairs of complementry 15 oligonucleoties (Table 9). The assembled oligonucleotides create the appropriate restriction fragment which was inserted into the (15-125) hIL-3 gene (pMON13288 [SEO ID NO:100] between these restriction sites. The deletions or substitutions 20 encoded by the oligonucleotide in the (15-125) IL-3 gene correspond to the amino acid deletions or substitutions in the variant polypeptide (Table 9). The amino acid substitutions or deletions, in addition to and/or different from those in the polypeptide #25 25 [SEQ ID NO:89] are indicated in Table 9. The biological activity (growth promoting activity in AML 193 cells) for some of the variants in Table 9 is shown in Table 1.

Formula XI shown below is a representation of a [(15-125)hIL-3 mutein] with numbers in bold type added above the amino acids to represent the position at which the amino acid below the bolded number appears in native (1-133)hIL-3 [e. g. the amino acid at position 1 of Formula XI corresponds to the Asn which appears at position 15 in native (1-133)hIL-3]. The number shown in bold indicates the amino acids that correspond to

the native IL-3(1-133). The non-bold members below the amino acids sequences are for Seq Id reference numbers. When the muteins are expressed the initial amino acid may be preceded by Met- or Met-Ala-.
